Arizona Department of Mines and Mineral Resources Mining Collection

ACCESS STATEMENT

These digitized collections are accessible for purposes of education and research. We have indicated what we know about copyright and rights of privacy, publicity, or trademark. Due to the nature of archival collections, we are not always able to identify this information. We are eager to hear from any rights owners, so that we may obtain accurate information. Upon request, we will remove material from public view while we address a rights issue.

CONSTRAINTS STATEMENT

The Arizona Geological Survey does not claim to control all rights for all materials in its collection. These rights include, but are not limited to: copyright, privacy rights, and cultural protection rights. The User hereby assumes all responsibility for obtaining any rights to use the material in excess of "fair use."

The Survey makes no intellectual property claims to the products created by individual authors in the manuscript collections, except when the author deeded those rights to the Survey or when those authors were employed by the State of Arizona and created intellectual products as a function of their official duties. The Survey does maintain property rights to the physical and digital representations of the works.

QUALITY STATEMENT

The Arizona Geological Survey is not responsible for the accuracy of the records, information, or opinions that may be contained in the files. The Survey collects, catalogs, and archives data on mineral properties regardless of its views of the veracity or accuracy of those data.

A.L. FLAGG - 1935 Report on Delta froup-Ace Mining + Development Co. Maricopa Counts Avizona

REPORT

on

DELTA GROUP

ACE MINING & DEVELOPMENT CO.

Maricopa County Arizona

ŵ

n 48

Phoenix, Arizona April 5th, 1935

A. L. Flagg Consulting Engineer Though the above record is very satisfactory, it is easily understood that to continue shipping without developing is an unsound policy which cannot be followed indefinitely. While this ore has been mined for shipment, no development has been carried on. However, this past year of operation has not made any serious inroad on the ore available. Instead it has opened up much ground, making possible a clearer understanding of the nature of the vein system, and exposing a considerable volume of mill ore in the main Delta workings. Until this situation is accurately set out in detail on an assay map, no positive statement can be made regarding the volume and value of such ore, but it is the opinion of those who have mined the ore that has been shipped, men of long experience, that a minimum of 50 tons per day, that will average \$8.00 in gold, can be mined from above the lowest adit on the main Delta system, for a period of two years. The writer agrees with this estimate.

As a potential source of profitable bodies of mill ore, the whole property merits serious consideration. The shipment of 3000 tons of ore, at a profit, demonstrates unmistakably the existence of pay values. Such sampling as has been done to date at many places outside the areas from which shipments have been made indicates a widespread distribution of gold values sufficiently high to yield a profit if the ores are milled on the ground. The most promising undeveloped sources of mill ore, the Leggat and Maxamillion veins can be prospected to a depth of at least 500-ft. by a system of adits at a very low cost. The cost of exploration on the Hall and Thompson claims will be more expensive but not necessarily very high.

The known distribution of gold over a considerable area, in profitable amount, justifies the exploration necessary to prove the volume of mill ore available, and there is every reason to anticipate a tonnage that will pay a satisfactory return on the investment.

Phoenix, Arizona December 1st. 1934.

1999 - Santon

Respectfully submitted,

Leflagg.

MAX*DELTA MINE SAMPLING

In cutting the samples described on the following pages, large amounts of material were taken. The samples were cut with (a) moils, (b) drift picks or (c) a stoper with a broad bit, according to the conditions at the site sampled. The average weight of the individual samples was more than thirty pounds.

Each sample was put through a chipmunk crusher twice, then put through a sample splitter. One half of the final cut was sent to the assayer and one half preserved by the Company.

The rejects from the splitting operations are still preserved, intact and in the original sacks. It is likely that these will be used later for any preliminary ore testing that may be carried on. ١

1- Across 12 inches compact quartz, on hanging wall, north side of winze, at portal of upper tunnel. 1.08 oz. gold 2- In uppertunnel; 3-ft south of Sta. 101 (portal) across 18 inches 2.42 oz. gold solid quartz on foot wall; light copper stains. 2A-At location No. 2; across 18 inches crushed vein material between quartz of No. 2 and hanging wall. 0.04 oz. gold 3- Ten feet south of No. 2. samples; across 9 inches quartz like No. 2 with less copper but more iron sulphides. 0.96 oz. gold 3A-At location No. 3; 18 inches of crushed vein material similiar to 2A, but on foot wall side of quartz. Tr. gold 4- Ten feet south of No. 3; across 26 inches crushed vein filling with few quartz streaks. 0.04 oz. gold 5- Ten feet south of No. 4: across 18 inches crushed vein filling with small amount of quartz. 0.10 oz. gold 6- Ten feet south of No. 5; across 14 inches similar to No. 5. with a little more quartz. 0.30 oz. gold 7- Ten feet south of No. 6; across 20 inches. on foot wall 2 inches of firm quartz, balance crushed vein filling. 0.76 oz. gold 8- Ten feet south of No. 7; across 16 inches of hard quartz on foot wall side of vein. 0.30 oz. gold 8A-At location No. 8; across 3-ft crushed vein filling from quartz of 0.06 oz. gold No. 8 hanging wall; some quartz stringers. 9- Ten feet south of No. 8; across 12 inches solid quartz in small raise from back of drift. 0.44 oz. gold 10- At Sta. 102, approximately 10-ft. south of No. 9: across 28 inches of quartz on footwall; two other quartz stringers not included. 1.50 oz. gold 11- Ten feet south of No. 10; across 12 inches guartz at the north end of small stope. 0.54 oz. gold 12- In back of small stope, approximately 10-ft. south of No. 12; across 18 inches crushed vein filling, some quartz. 0.30 oz. gold 13- In back of small stope, approximately ten feet south of No. 12; 20 feet above the rail, across 2-ft, mostly quartz. 0.52 oz. gold 14- In back of small stope, approximately 10-ft. south of No. 13, about 12-ft. above rail across 24 inches crushed vein filling and quartz with the quartz predominating. 1.32 oz. gold

- 15- In back of small stope, approximately 10 feet south of No. 14, across 36 inches crushed quartz and vein filling, 10-ft above rail. 0.72 oz. gold
- 16- Ten feet back from face upper tunnel, across 42 inches of back, of which 6 inches on footwall is quartz, rest crushed vein. 0.24 oz. gold
- 17- On 200 level; approximately opposite Sta. 203, at north end of underhand stope; 6 inches quartz on hanging wall, 6 inches crushed vein.
 0.24 oz. gold
- 18- Across 12 inches in footwall, in "glory hole" around old shaft, about 25-ft above rail, 200 level.
 0.10 oz. gold
- 19- Across 35 inches directly above No. 18. 0.80 oz. gold
- 20- On south side of shaft "glory hole" about 20-ft. above rail, across 48 inches quartz and crushed vein filling. 0.14 oz. gold
- 21- On south side of shaft "glory hole", about 5-ft. below No. 20, across 84 inches quartz and crushed vein filling. 0.16 oz. gold
- 22-On 200 level; about 5-ft north of Sta. 205, across 36 inches of shattered quartz. 0.26 oz. gold
- 23- See Drill Hole Sample No. D-1.
- 24- At Sta. 205 on 200 level; across 24 inches crushed vein filling with little or no quartz. 0.20 oz. gold
- 25- On 200 level; 13-ft south of Sta. 205, across 24 inches with a small amount of quartz. 0.38 oz. gold
- 26- Across 24 inches, mostly quartz, on east side of drift, just opposite chute No. 5. 0. 52 oz. gold
- 27- Missing.

÷.

- 28- On 200 level, from back of drift on north side of chute No. 5, across 48 inches, much quartz. 0.02 oz. gold
- 29- On 200 level; across 48 inches on south side of manway at chute no. 5, about 8-ft above rail, just above platform. 0.10 oz. gold
- 29A-In stope off 200 level; above chute no. 5, 20-ft above rail and over platform, across 36 inches, mostly quartz. 0.28 oz. gold
- 29B- Opposite No. 29A, in stope above chute No.5, 200 level, across 16 inches quartz and crushed vein on south side of stope. 0.80 oz. gold
 - 30- Sta. 207 plus 8-ft north end of stope; across 6-ft. of crushed material, ore in wall. 0.16 os. gold

30A- Across 33 inches of mineralized footwall, under No. 30, in 0.10 oz. gold the footwall. 31- In center of back of stope at Sta. 207 plus 8-ft. across 6-ft. of crushed material, mostly quartz. 0.16 oz. gold 32- In 200 level; approximately at Sta. 208, across 30 inches of hard dull quartz. 0. 24 oz. gold 33- In 200 level (on vertical of "B" vein) across 6 inches crushed 0.28 oz. gold quartz and voin filling. 34- In 200 level, on "B" vein, in short crosscut near Sta. 213 across 10 inches, north side. 0.80 oz. gold 34A-On opposite side of short crosscut, at location No. 34. on "B" vein, across 14 inchés quartz. 1.00 oz. gold 35- On 300 level, in north face of drift, across 10 inches quartz in hanging wall vein, 5-ft back from face. 0.04 oz. gold 36- On 300 level: 11-ft south of No. 35, across 16 inches crushed vein with very little quartz. 0.12 oz. gold 37- On 300 level; 3-ft. south of face of north drift, across 18 inches of crushed vein filling. 0.10 oz. gold 38- On 300 level; at north side of chute at Sta. 305, across 24 inches of dull quartz. 0.08 oz. gold 39- On 300 level; on south of chute, same location as No. 38, across 48 inches of quartz. 0.06 oz. gold 40- On 300 level; approximately at Sta. 305 (old) across 48 inches of quartz. 0.16 oz. gold 41- On 300 level; across 50 inches quartz, firm and dull, about ten feet south of No. 40. 0.12 oz. gold 42- On 300 level; on south side of 500-ft. incline shaft, across 54 inches dull quartz. 0.06 oz. gold 43- On 300 level; about 20-ft north of Sta. 306 (old) across 36 inches crushed vein on fotwall side. 0.10 oz. gold 43B-On 300 nlevel; at location No. 43. across 24 inches of dull quartz next above No. 43. 0.02 oz. gold 43C-On 300 level; at location No. 43, across 36 inches, prushed vein and quartz, east of 43B. 43D-On 300 level; at location No. 43 across 48 inches, next east of 43C, all crushed vein material. 0.08 oz. gold 44- On 300 level; across 36 inches in face of small drift started near location Nos. 43 to 43D, 6 inches quartz on west.

0.06 oz. gold

45- On 300 level: from N side of manway in chute at Sta. 306 across 7g feet. 0.08 oz. gold 46- On 300 level; north side of crossout, opposite chute near Sta. 306 (old) cross 30 inches quartz. 0.10 oz. gold 47- On 300 level; south side of chute near Sta. 306 (old) across 36 inches mostly quartz. 0.30 oz. gold 48- On 300 level; across 36 inches, mostly quartz approximately at Sta. 307, old survey. 0.10 oz. gold 49- On 300 level; above No. 48, just under bulkhead in manway, across 36 inches; 12 inches quartz, rest crushed vein filling. 0.36 oz gold 50- On 300 level; just above bulkhead, in manway, across 36 inches 0.64 oz. gold in pillar. 51- On 300 level; in back of stope, above 307 raise, across 36 inches of vein matter. 0.40 oz. gold 52- On 300 level; location of No. 51, about in center of stope, across 36 inches vein matter. 0.14 oz. gold 53- On 300 level, in same stope, south side, on pillar next to raise, across 108 inches. 0.24 oz. gold 54- On 300 level; in same stope, south side of pillar, location No. 53 across 40 inches. 0.16 oz. gold 55- On 300 level; in same stope, directly over platform, between two chutes, across 106 inches. 0.22 oz gold 56- On 300 level; in same stope, opposite No. 54, on south side of 0.22 oz. gold raise to 200 level, across 41 inches. 57- On 300 level; in same stope, on south side of raise, about 12-ft below No. 56, across 30 inches crushed vein material. 0.38 oz. gold 58- On 300 level; around turn from Sta. 308 (old) plus 5-ft across 41 inches. 0.12 oz. gold 59- On 300 level: at north end of first underhand stope, just beyond Sta. 308 (old) 5-ft. below rail, across 48 inches. 0.40 cz. gold 60- On 300 level; as same underhand stope, about 8-ft. below rail level, across 36 inches. 0.80 oz. gold 61- On 300 level; directly above No. 60, about rail level, across 30 inches, hangingwall showing sulphides. 0.48 oz. gold 62- On 300 level; above No. 60 at rail level, across 24 inches of quartz on the footwall. 0.40 oz gold 63- On the 300 level; in south end of new stope, south side of raise, about 12-ft. above rail, across 36 inches in footwall showing sulphides with little or no quartz. 0.80 oz. gold 634-Approximately the same cut as No. 63, coarse. 0.36 oz. gold 64- On 300 level; at north end of next underhand stope, three feet below rail level, across 24 inches guartz. 0.28 oz. gold 65- On 300 level; at bottom of north end, same underhand stope, across 48 inches, including 10 inches footwall mineralized. 0.82 oz. gold 66- On 300 level; at bottom south end same underhand stope, about 8-ft. below rail, across 36 in. (ore in both walls still). 0.32 oz. gold 67- On 300 level; directly above No. 66 at nearly rail level, across 24 inches, but still ore in both walls. 0.14 oz gold 68- On 300 level; in raise near south end, last underhand stope, across 48 inches about 30 feet above rail. 0.12 oz. gold 69- On 300 level; in raise location No. 68, some 5-ft lower, across 18 inches footwall material and heavy sulphides. 0.56 oz. gold 70- On 300 level; fifteen feet from face, across 12 inches crushed vein material, in back of drift, no quartz.t 0.10 oz. gold 71- On 300 level; across 12 inches of quartz in face of drift, as of October 1, 1934. 0.82 oz. gold 72- Above the 200 level; location No. 73, sample gob, 0.16 oz. gold 73- Above 200 level; sample of gob in new stope. 0.20 oz gold 74- On 200 level; in inclined raise, at first chute, 12 inches 0.26 oz. gold of quartz dipping west. 75- On 200 level: at location No. 74. in raise on east side, across 36 inches, hangingwall streak ("A" vein). 0.34 oz. gold 76- To 90 inclusive, outside small samples, on subsequent list. 91- On 400 level; or 10 inches on hangingwall side directly under dike, at beginning of drift from shaft. 0.02 oz. gold 914-On 400 level; directly under No. 91, across 24 inches crushed vein matter, much quartz. 0.68 oz. gold

1

92- On 400 level; one foot south of No. 91, across 24 inches white quartz, some siderite, no hematite. 0.08 oz. gold 93- On 400 level; 10-ft south of No. 92, across 30 inches white quartz, some iron stain, some sulphides, no hematite. 0.02 oz. gold 94- On 400 level; 10-ft. south of No. 93, across 14 inches quartz, vein narrowing to south into break. 0.22 oz. gold 95- On 400 level; Sta. 402 plus 23 ft. across 18 inches of which 4 inches are quartz, rest crushed vein material. 0.06 oz. gold 96- On 400 level: Sta. 402 plus 33 ft, across 18 inches crushed material and 2 inches quartz. 0.04 oz. gold 97- On 400 level; 10-ft. south of No. 96 across 12 inches crushed material and fine quartz, in fault breceia. 0.06 oz. gold 98- On 400 level; 10-ft. south of No. 97, across 20 inches fault breccia under smooth wall. 0.10 oz. gold 99- On 400 level; 10-ft. south of No. 98, chipped out of hard smooth wall. 0.06 oz. gold 100- On 400 level; face across 41 inches crushed material with no 0.06 oz. gold appreciable amount of quartz. 101- On 400 level; north of station 402 about 12 feet, across 36 inches of disrite and sulphides, with some quartz. 0.04 oz. gold 102- On 400 level; incrosscut west from Sta. 402. at face 36 inches down the south face of crosscut. 0.06 oz. gold 102A-On 400 level; in crosscut, west from 402, at face across 48 0.08 oz. gold inches north side. 102B-On 400 level; incrosscut west from 402, at face across 49 inches north side. 0.08 ex. gold 106- In 500-ft incline, just under platform at 300 level, across 48 inches dull quartz. 0.08 oz. gold 107- In 500-ft, incline shaft, on north side, about 30-ft. down from No. 106, across 36 inches. 0.10 oz. gold

Max-Delta Samples Page 7

Drill-Hole Samples

A few test drill holes were drilled into the walls, not for the purpose of adequately prospecting, but more to determine to what extent the gold values might reach into the wall in selected spots. There are not the necessary facilities for deep drilling, which might disclose more important data. In the further development of the property drilling should play an important part. The few holes drilled indicate some values in the walls.

- D-1 On the 200 level; into hanging wall near Sta. 205, depth of hole 65 inches, 0.02 oz. gold
- D-2 On the 200 level; approximately 20-ft. south of D-1; depth of hole 60 inches, 0.10 ez. gold
- D-3 On the 200 level; approximately 11 feet south of D-2, depth of hole 30 inches, 0.02 oz. gold
- D-4 On the 200 level; approximately 12-ft. south of D-3 depth of hole 60 inches, 0.02 oz. gold
- D-5 On the 4-- level; at location of cut sample No. 98, depth of hole, 62 inches, 0.04 oz. gold
- D-6 On the 400 level; at location of cut sample No. 97, Depth of hole 36 inches, 0.02 oz. gold
- D-7 On the 400 level; at location of out sample No. 96, depth of hole 62 inches, 0.12 oz. gold
- D-8 On the 400 level; abandoned, bad ground.
- D-9 On the 400 level; opposite Sta. 402, depth of hole 62 inches, 0.02 oz. gold
- D-10 On the 400 level; at sample 101, above heavy sulphides area and probably into dike, 63 inches, 0.04 oz. gold

Max-Delta Outside Samples Page 8

ť

The following samples are from locations outside the main workings (Sketch No. 2) with the exception of a few samples of old fill which ran into and still lies in the shaft. It is not clained that the whole property has been sampled thoroughly as yet, for there are many shallow openings, as well as inconspicuous outcrops, which have not been investigated. In addition to the samples listed herein a great many more have been taken by the Company or by leasees. These are not described because no accurate sampling information is available as to the exact location or the sampling conditions.

- 76 From open cut, south side of read, on Delta No.2 claim. Only shattered outcrop, vein not in place. 9.54 oz. gold
- 77 From shaft 10-ft. deep, east side of draw, northeast of Hall shaft; Vein Str. N. 17 W, Dip 80, East; 10 inches quartz. 1.10 oz. gold
- 78 On knoll west of No. 77; shallow shaft, 8-ft. deep, vein str. S 40 E, dip W 87; 12 inches quartz on hanging wall, 10 inches crushed vein fill (horse?) 4 inches quartz on foot wall. 1.50 oz; gold
- 79 Sample of about one ton on dump of 125-ft. incline shaft on Thompson claim (ore shipped). 3.08 oz. gold
- 80 Open cut on ridge north of Hall shaft vein strike S 30 E, dip 47 W; across 36 inches quartz and schist lenses.).40 oz. gold
- 81 On ridge north of Hall shaft; shallow open cut, showing broken outcrop 20 inches wide, Str S 25 E, dip W 67. 0.48 oz. gold
- 82 Shallow opening in guleh on Thompson dlaim, near south end; flat vein 6 inches, Str. S 20 W. 0.74 oz. gold
- 83 At "Double Incline Shaft" on Thompson claim; vein Str. S 20 E, dip 69 W, 4 to 10 inches broken quartz. 5.32 oz gold
- 84 Open cut on ridge NE of 125-ft incline shaft; vein Str N 5 E, dip E 82; 4 to 10 inches quartz with heavy iron stain. 1.26 oz. gold
- 85 Narrow quartz stringer on N side of road, Se of Hall Shaft; a pile of 300 lbs shipped. Vein Str N 15 E vein irregular. 0.42 oz. gold

85 ANorth of No. 85 about 50-ft; in shaft 10-ft deep a 7 inch quartz stringer; possibly not in place. 0.88 oz. gold

()

Max-Delta Outside Samples Page 9

86- South side of road, near No. 85 shallow open cut; vein Str. S 12 W; dip 78 E; 7 inches quartz. 0.36 oz. gold

87- Pile of ore shipped, about 700 lbs. 0.24 oz. gold

- 88- From outcrop east side of gulch, east of Thompson, location of new claim; across 3 feet. 0.08 oz. gold
- 89- Across 10 inches quartz, north side 2-ft. hole Maxamillion claim, near SW corner. 14.04 oz. gold
- 90- Open cut south of Hall shaft, Str S & E, shattered quartz, outorop definite walls not visible, quartz blocks 10 to 14 inches in thickness, probable width of streak. 0.52 oz. gold

91-108-ommitted

108-	Flat	from	flat,	south	end	0_{ra}	Granda	0.04	oz.	gold
------	------	------	-------	-------	-----	----------	--------	------	-----	------

109_ Float from flat south end of Ora Granda 0.02 oz. gold

110- Float from south end Ora Granda 0.02 oz. gold

- 111- Across 10 inch outcrop in draw, S 5 E 100-ft. from south end of rhyolite dike west of Sta. 100, Str S 25 W.0.08 oz. gold
- 112- Float in main Delta wash at S end Rhyolite dike (Fll) at junction with east draw. 0.02 oz. gold
- 113- Adit on old "Montana"; open cut 15-ft. tunnel, 10-ft, across 4 inches gouge and crushed quartz and 8 inches solid quartz. 0.16 oz. gold
- 114- From open cut above sample No. 113, 8 inches quartz on E side; Vein Str S 10 E, dip E 70. 0.02 oz. gold
- 115- Across 36 inches soft gouge-like material with some crushed quartz. directly under No. 115. 0.30 oz. gold
- 116- Across 16 inches quartz in opening east of trail near "Glory hole" on Maxamillion on peak. 0.88 cz. gold
- 117- Across 30 inches firm quartz and 4 inches of gouge same location Nos. 115 and 116, but above. 0.46 oz. gold
- 118- On east side old "Glory Hole " Maxamillion, across 16 inches soft material, including 4 inches waste; above No. 117. 0.26 oz. gold
- 119- Across 30 inches quartz in "Three Way Tunnel" near north end line of Maxamillion claim. 0.46 oz. gold

- 120- Across 54 inches about 30-ft. above portal of 150-ft. tunnel on Maxamillion claim; west streak. 0.26 oz. gold

Total	\$ 42.50
To this is added compensation insurance, overhead	
25% for safety factor, giving total per foct cost	\$ 15.10

ACE MINING & DEVELOPMENT COMPANY

GEOLOGICAL REPORT

The geological studies of the Delta Mine, property of the Aće "ining & Development Company, have been divided into three purely arbitrary parts, a division based in part on the immediate requirements of the operating company, in connection with it's development, and in part on the natural geographical divisions of the property. The first area to be mapped and studied in detail comprises those parts of the Delta and the Delta No. 2 claims shown in Sketch 2, which accompanies this report. The second unit takes in the Delta No. 3, the Hall and Thompson claims. The third unit deals with the "eggat and Maxamillion claims.

In the absence of any petrographic studies, the rock classification used in this report necessarily will be subject to revision and correction. The immediate requirements of the operators do not make it necessary to draw fine distinctions of rock classification. On the other hand more detail than is available with respect to the nature and the composition of the ores is really desirable. The matter of ore genesis will not be discussed in this report.

Ŷ

ACE MINING & DEVEOPMENT COMPANY

GEOLOGICAL REPORT

PART I

Broadly speaking the rock formation in the area to be described in Part I consists of a complex series of dark gneissic rocks, believed to occur as a roof pendant in the granite batholith underlying the South Mountains and adjacent areas. Pegmatite and aplite dikes, one or more rhyolite porphyritic dikes and possibly a fine grained, dark, basic dike of approximate diorite composition have been encountered in the first dividing of the territory. In the area covered by Part II there are some considerable quantities of a light sericitic schist and a darker rook, which is principally hornblende. These have not been found to any extent in either the other areas.

The principal featured of the gneissic formation are: (1) the general predominance of dark colored minerals; (2) conspicuous deformation in certain sections which probably antedates the period of ore deposition; (3) it's blocky nature; (4) occasional weaker or softer zones which sometimes have considerable influence on the physical nature of the ore deposit; and (5) a striking irregularity in the distribution of the several most conspicuous characteristics.

In a preliminary report on the property, dated December 1, 1934, on page two, the occurrence of three veins of different strike and dip was mentioned. It is probable that the descriptions of the separate veins may require modification after more work is done. At the present time it seems that the vein striking N 10 W with a low dip to the east probably has a northeasterly strike. As development proceeds and more is learned about the individual veins, and their inter-relation more accurate statements can be made as to the age, position and importance of each vein.

Such records of previous operations are available, indicate that the principal reason for the abandonment of the property by the original operators was the failure to appreciate the true significance of some of the complicated geological structure. There is no indication that any of the previous operators realized that such veins as had been partially prospected in these principal workings were definitely cut off by a fault just below the lowest adit level (300 level) and that the shaft had been sunk from this point in the fault plane. There is no intimation that more than one vein had been recognised in these workings.

An appreciation of these fundamentals is essential to the proper and successful development of the property. Even a partial solution of this problem requires a large amount of detailed mapping. The most essential data are shown on the two underground geological maps attached hereto.

The drift on the 400 level appears to have been driven entirely along a fault which shows many indications of considerable movement, without a clue as to the probable extent or direction of such movement. Nothing definite can be said as to it's relative age. The fault breccia is very fine and the fault zone moderately wide. Along with the fault, commencing at the shaft and extending southward about forty feet on the hanging wall side of the fault is a small amount of quartz, carrying low gold values. This quartz ends abruptly against a block of unaltered gneiss. Beyond this point the hanging wall shows sulphides, in the gneiss, in varying amounts. This wall has never been crosscut.

The Shaft Fault (Fault "A" on the maps) and this 400 level fault, (Fault "B" on the maps) appear to intersect on the 400 level about at the shaft. The calculated intersection on the 300 level is shown in Figures I and II on "Underground Geology I". In figure I is the grappic method of determining the angle and course of this intersection. If these deductions are correct it is very evident that neither of these two faults will ever interfere with the further development of the steeper dipping veins as they are followed along their strike to the south.

In the face of the east crosscut just south of the shaft on the 300 level is an exposure of a rhyolite dike. The crosscut was not carried into the dike far enough to afford any dependable information as to the strike, dip or width. It is assumed that this is the foot-wall of the same dike exposed in the crosscut to the west, directly under in the 400 level. In calculating the probable movement of this dike vertical and horizontal (horizontal only at right angles to the plane of the dike) this exposure is assumed to have the same strike and dip as the foot-wall below. It is believed that the dike is faulted by the "A" fault, evidence of great disturbance beginning at a point about 20-ft. east of the centerline of the 300 level drift from which this crosscut takes off, and extending right to the dike. In Figure III the displacement of the dike is shown (Underground Geology I). The calculations indicate that the so-called "Shaft Vein" and possibly much of the profitable shoot in Zone I^I, Underground Geology II, are to be sought southwest of the shaft at about 70 feet distance.

On the second (II) map of underground geology the major features of the first four levels are shown. Very little work is done on the fifth level (see Assay Map) and no detailed mapping was done there. The bottom level or whatever other work may be below this fifth level is under water and so inaccessible. So far as is inown there is no dependable map of any of these lowest workings. Summing up the situation in the area covered by Part I, or as much of it as has been studied in detail there appears to be definitely available, more than 10,000 tons (10,326) of ore having an average gold content of 0.432 ounce to the ton. There is every reason to anticipate the extention to the south and vertically of the two major veins of Zone IV, in areas of much less post-mineral disturbance. From what is known of them, they may be expected to yield a considerable tonnage of very profitable ore.

Part II (Outline)

The detailed mapping of the area to be covered in Part II is not completed. Preliminary investigations indicate several promising shoots and surface sampling is very satisfactopy. The deepest work in this section, now inaccessible, is reported to show a considerable width of mill ore. From this area, leasers have shipped during the past eighteen months several hundred tons of ore that has been profitable, and compared favorably in it's gold cont with the ore from other locations on the property.

Part III (Outling)

Nothing but preliminary investigating and some surface sampling has been done in this section. The detailed work here bids fair to be of very great importance because of the possible large tonnage of mill ore. No other portion of the property seems to promise so much in the way of large tonnage for a similar area as is to be found here. The contour of the land makes it possible to develop it cheaply, by tunnels, and quickly. Ore can be delivered by a gravity tranway to any feasible mill site on the whole property. From very shallow and limited surface workings more than 500 tons of ore have been shipped by leasers. The average gold content was over 0.70 ounce to the ton and some very high assays have been had on surface samples.

Though on some parts of the Delta property the geology is undoubtedly somewhat complicated there is no indication of the kind of problems impossible of solution. Accurate observation of the features as the development proceeds will be of great help in solving any problem that is met with. Nothing has been observed about the property to indicate definite limits beyond which further prospecting is almost certain to be futile. On the contrary such evidence as is available creates confidence in the future of the property. Past production records, positive ore in the principal Delta workings, and the probable ore indicated at many places where leasing operations have been carried out profitably, give assurance of a sufficient volume of ore to justify the starting of a comprehensive development program, which may be expected to indicate, very shortly, the advisability of providing a mill on the property.

Phoenix, Arizona April 5, 1935 Respectfully submitted.

W.G. Slagg

Miscellaneous exploration in this area, as suggested in the Geological Report, to the extent of about \$2500 is justified. In this connection the use of some standard portable diamond drill might prove advantageous and such a drill can be used very profitably on other parts of the property.

It has been suggested that a crosscut be driven from the lower Mest Delta tunnel (see Sketch 2) to connect with the 500 feet incline shaft. This would intersect the shaft at a point about sixty feet below the 300 level and the length of the crosscut would be six hundred feet. The cost of such a crosscut is estimated to be \$15,000. It would afford a cross-section of the less extensively explored area on the west of the main Delta workings and, of course, would accomplish what the projected crosscut from the 400 level would do with respect to the faulted segments.

The next most important development project is on the Leggat and Maxamillion claims, referred to as the "Max" by those familiar with the property. The natural advantages of this sttuation were pointed out in the general report. Though there is a considerable amount of work done on these two claims, nothing can be said about the amount of ore that is developed, except that there are several thousand tons of material on dumps that are suitable for milling. The scattered development have disclosed conditions sufficiently convincing to justify a rather elaborate program of work in this section. A compressor of not less than 350 cu. ft. capacity and the necessary accessory equipment should be provided. It is believed that this is the greatest potential source of mill ore on the property.

If these larger plans of development outlined above are carried out no elaborate program is necessary for the Hall-Thompson group for the present. The work suggested above is calculated to afford enough ore to supply a suitable mill for some time to come. However, from time to time some exploratory work should be done on the Hall-Thompson group. The Donivin-Tinney lease area should be explored at depth and certainly the 125-ft. incline shaft should be investigated. For this work it would seem that not more than \$5000 need be provided for the first year.

The above development programs calls for an expenditure of \$65,000 if all the projects are undertaken. This is believed to be ample for the work contemplated and sufficient to open up the property to a point where actual production will take care of all further development. To this sum must be added the cost of the necessary equipment. Such equipment as there is on the ground now is satisfactory for the sort of work in progress but it is not suited to the proposed work. Very little will be required in the way of buildings and almost nothing for roads. Suitable mining equipment is the most important thing. The estimated cost of all the requirements is \$35,000. Four somes are laid out on the "Underground Geology II" map, by which it is hoped to express a little more clearly the conditions due to vein intersections and the small amount of postmineral movement. No satisfactory theory can be formulated concerning the supposed faulting of the veins on each other until more ground has been opened up. To differentiate between the several veins more must be known about the specific nature of individual veins and more positions must be mapped. It is believed that most of this necessary information will be disclosed in the normal progress of exploration without any special or expensive side development.

At best any attempt to express in plan such conditions can be only an approximation because geological phenomena do not confine themselves to straight lines or plane surfaces. It is also true that some features not observed, or if observed possibly considered inconsequential, may have influenced the situation profoundly, even to the extent of rendering almost uscless some of the conclusions drawn. The zones referred to include only ground above the floor of the 300 level.

Zone I is an area of limited horizontal extent. It seems to indicate a section containing but one of the veins, rather erratic in strike, with a moderately steep dip to the east. No much high grade one has been taken from this zone. Values are low but the width of the vein is very much greater at some points than anywhere auth of the shaft. Certain prominent characteristics of higher grade shoots in otherparts of the mine have been observed near the present ends (north) in this zone. Extention of the drift on the 300-ft. level northwesterly might disclose other shoots of shipping ore. On it's dip, in this zone, this vein is affected by the "A" fault.

During the early part of the present operations Zone II was the most productive part of the property. Stope widths of five feet (wall to wall) of ore carrying almost an ounce to the ton were seen. This zone is an area of intersections. Apparently the three vein systems, noted previously, intersect with this zone at these levels. If the calculated effect of the disturbance along the "A" Fault is proven this zone of intersections should prove profitable for quite a depth below. One of the determining factors in the question of what depth is the relative strikes and dips of the veins that are involved. It is believed that this zone still has some possiblities above the 300 level. The most abundant evidence remaining of the real nature of this zone, i. e., that is a zone of intersections, is to be found in the stoped section above the 200 level. Some dependable data can still be obtained from the "Intermediate Level" and pillars left in the stopes.

Zone III is a transition area. The so-called "Flat vein" has not been identified here and there is strong evidence to support the belief that there has been a shifting of positions beTHE DELTA MINE

The property of the Ace Mining and Development Company, formerly known as the Max-Delta Mine, is in Maricopa County, State of Arizona. It is in the northern portion of the Salt River Mountains, that portion familiarly known to the residents of Phoenix as the "South Mountains". It is ten miles from the civic center of Phoenix to the property.

There are nine patented and five unpatented mining claims in the property. With the exception of the Ora'Granda, which sets apart from the rest, the claims are all in one group.

The equipment on the property at the present time is very limited. It consists of a portable compressor, a small gasoline hoist, drills, track, cars, pipe and steel, blacksmith shop for hand sharpening and loading terminals. All of the original equipment, even to mine timbers and the collar of the shaft, was removed many years ago. Though simple, the equipment on the property meets all the most immediate requirements.

There is no water developed on the property. It is reported that the 500-foot inclined shaft furnished enough water for the 25-ton mill which was on the property at one time. There is also some water in the Hall Shaft. In all probability water can be developed by drilling wells in the property not over 200-ft. deep.

There are no transportation difficulties. Seven miles of the road from Phoenix is either paved or oiled. The rest of the road is very good road. Ore is hauled in trucks to Phoenix and loaded for 75% a ton.

The claims lie on the north slope of the mountains, at elevations ranging from 1200 to 2600 feet above sea level. The country rock is a complex of gneiss and schist, with a general southerly at low angles. There are frequent local variations due to faulting. Several fine grained, dark dikes, probably diorite, occur and there is at least one lighter colored, porphyritic dike, of an acid composition, provisionally called rhyolite. Irregular dikes of aplite and pegmatite are abundant throughout the range. Outcrops of veins, excepting the pegmatite dikes, are inconspicuous. In marked contrast is the abundance of quartz float on the mountainside.

The veins are fissures cutting across the gneiss with a general NN to SE strike and easterly dip. The country rock on either side of the veins, more particularly noticeable at lower depths, is more or less silicified, the mineralization extending out into the walls for an undetermined distance. The vein filling is largely quartz, with altered inclusions of country rock. Gold is the principal metal, silver is present in small amounts, and copper to the extent of less than one-half of one per cent. There is neither lead nor zinc. Sulphides of iron are found at practically all horizons. No investigation has been made of the water situation. All the water now used about the mine is brought in barrels. The 500-ft. incline shaft is said to have furnished ample water for a small mill in 1916-17 but as the operations of the mill were not steady, this information is of doubtful value. The Hall shaft, nearly 100-ft. deep, has some water but there is no accurate data regarding the amount it will produce. If sufficient water cannot be developed in drilled wells in the east-west valley crossing the property an almost limitless supply, far in excess of the property's needs can be had at a short distance north. The development of an adequate water supply is not considered to be a serious problem.

While the underground development is in progress serious thought should be given to the subject of a mill. The rejects from systematic sampling during the last part of 1934 have been saved for testing purposes, for preliminary work this is the most satisfactory material that can be obtained. It is an accurate representation of all the ore exposed at the time the sampling was done. There is probably a ton or more of this material, which is ample. Properly conducted tests will indicate the essential features for the most sutable mill to give the best results. In all probability it will be an all flotation plant. Assuming that it will be and that the capacity is to be 100 tons per 24 hours the probable cost will be \$75,000.

To determine what material in the mine may be classed as one it is necessary to know the cost of mining and the cost of milling. Tonarrive at the total cost there should be added to thid a sum sufficient to cover the interest on the original investment, the depreciation of the equipment and the depletion of the mine. taxes and emortization.

Past experience in the mine indicates that when the work is properly organized the mining cost should not exceed \$3.00 per ton. In mill of 100 ton daily capacity, operating on ores of a somewhat similar nature and making recoveries in excess of 90% the costs do not exceed \$3.00 per ton. If to this is added \$1.50 per ton to cover the fixed charged indicated above, then the indicated minimum grade of material that can be mined and milled without any loss is \$7.50; that is the ore must centain at least \$7.50 in recoverable value or it cannot be handled. Sampling to date indicates that the general average recoverable content is quite a bit more than this.

The recommendations may be summarized as follows: (1) the property should be equipped with the necessary machinery and other facilities to insure efficient and economical results in whatever development program is determined upon; the estimated cost of these improvements is put at \$35,000. (2) major development programs on the Delta and Max groups to cost \$20,000 and \$25,000 respectively; (3) mill construction, based on tests of the ore and other pertinent data, to cost \$75,000. In addition alternative or secondary development projects have been suggested involving an expenditure of another \$20,000. If all the projects are carried out the total capital outlay will be approximately \$175,000.

Respectfully submitted

RECOMMENDATIONS

A study of the general report and the geological report on the Delta property of the Ace Mining and Development Company clearly indicates that there is no lack of places in which development can be expected to show satisfactory results. Leasing operations at many points on the ground have indicated the existence of profitable ore bodies. Therefore the determination of a site or sites for further development work becomes simply a matter of the funds available for such work. For that reason all of the more important possiblities will be discussed rather than attempting to lay out a specific plan.

^Maturally the area described in ^Part I of the Geological Report is the most attractive because it has the most extensive development now and the most is known about this particular section. As is indicated in that report there is a known tonnage of ore with an average gold content that will yield a very satisfactory profit, if treated on the ground. There is also a small amount of ore used in the gob above the 200 level and a dum, estimated to contain 9000 tons which the original operators planned to mill. In this connection it might be mentioned that there are many hundreds of tons of material on dumps scattered over the property which can be treated to a profit on the ground.

There are tow important pieces of development work possible in this section. The first is the further exploration of the two veins in Zone IV, which is now in progress. All the work done on these veins beyond the point where they separate has paid for itself. The new drift just begun on the S 10 W vein gives promis of doing as well. ¹¹owever, it is going to be expected that leaner zones will be encountered with ore of a grade that cannot be shipped. In any development plan it is desirable to allocate at least \$10,000 for the immediate exploration of these two veins on and above the 300 level. Further development of these veins would follow as a matter of course in the normal operation of the property.

The most economical manner in which these two veins can be opened up below the 300 level is through a winze. If the raise now being put through to the 200 level is carried through to the surface, such a winze could be started directly under the raise and the sinking carried on from the surface, as an independent operation. The probable cost of completing the connection with the surface will be about \$1000. To this should be added some \$4000 to explore below the 300 level.

The cost of driving the proposed crosscut on the 400 level, southwest from the shaft to cut the faulted segments of the vein opened above in Zones I and II will be about \$2000. Another \$500 should be allowed for any possible incidental expense that may be incurred in preparing for this work. The original discovery on these claims is said to have been made on the crest of the ridge at an elevation of approximately 2600 feet above sea level, on the Maxamillion claim. Near the surface, this vein has a low dip and can be traced for 600 to 800-ft. along it's strike on the surface, showing widths from 3 to 12 feet. Humerous small openings made many years age, are said to have yielded about \$30,000.00 in gold. The vertical range on this vein from the highest point on the crest to the lewest working on the north slope, is about 400-ft, which would be over 600-ft. measured on the dip. No systematic development has been done on this part of the property but previous sampling in the old openings give very promising indiactions of a large amount of milling ore above an adit which would enter about 300-ft. below the highest point and would have a length of over 700-ft, when vertically under the original discovery. At present ore is being shipped off this part of the property.

Near the north end of the Maxamillion claim a spur takes off this vein with a more northerly strike. This vein is known as the Leggat vein. Not much work has been done on it. There is from 3 to 4 feet of ore along the outerep over a considerable distance. Previous sampling indicates a gold content sufficiently high to warrant the expectation of profitable mill ore.

The topography is such that the Maxamillion and Leggat veins can be prospected very cheaply by a system of adits, the lowest of which would attain a maximum depth of nearly 800-ft. measured on the dip. Mill ore from this system could be transported to a mill on the main Delta claim by gravity.

The most extensive development on the whole property is on the Delta No. 1 claim. It consists of an inclined shaft, 500-ft. in depth, with not less than 2500-ft. of tunnels. Two adits, entering from the north, intercept this shaft at levels approximately 50 and 100 ft. respectively from the surface. It is from these two adits and above that most of the shipping ore has been taken during the past nine months. Present operations have not included any of the levels below the lower of these two adits. Water stands in the shaft at about 100-ft. above the bottom of the shaft and nothing is known about the lowest level.

The Delta vein system is an interesting one on which, as yet, not enough information has been compiled to attempt a detailed description. The acid perphyry dike, mentioned above, is seen first in the level next below the lower of the two adits. What it's relation, if any, to the veins may be has not been worked out yet. The fundamental facts regarding the Delta vein system are that it consists of three veins, intersecting and faulted on each other, containing overlapping ore-shoots of moderate size in which there are similarly shaped and similarly oriented lenses of quartz of higher grade which constitute the shipping ore. The strike and dip of the three veins are (1) Strike N 60 W, Dip 50 NE; (2) Strike N 30 W, Dip 60 NE; (3) Strike N 10 W, Dip 20 (sometimes even less) to 40 NE. The principal workings of the West Delta consist of (1) a 62-ft crossout tunnel at an elevation slightly higher than the lower adit on the main Delta, from which about 200-ft of drifting has been done. It was from this part of the property that one was mined for the little mill years ago. During the present operations one has been shipped steadily from this vein. Though the strike of this vein is NW to SE as is the case with the other veins, the dip is to the SW in the upper workings.

From a flat, about 85-ft. lower than the last mentioned working, a long crossout tunnel of nearly 400-ft. has been driven, together with other work totalling about another hundred feet. This was to explore the West Delta vein at this horizon, and was done many years ago. No work has been done here recently. It is probable that this crossout will furnish the data necessary for the solution of the faulting in this vein system.

On the Hall claim, north of the Delta, is a shaft 100-ft. deep from which there is some drifting and crosscutting. The ore here is from 3 to 4-ft. in width and recently leasers have taken out two or three cars.

On the Thompson claim, which adjoins the Hall on it's north end line, there is a shaft 124-ft. deep and several other openings of lesser extent, none of which have been worked during the present operations.

The Ora Granda claim, which lies on a south slope of the mountains about 3000 feet north of the north end line of the Leggat, has not been worked under the present program. The outcrop is one of the most conspicuous on the whole property and the float from it, strewn over a wide area, amounts to many thousand tons. Several old reports on the property credit this claim with a large tonnage of ore that assayed nearly \$5.00 in gold. No systematic sampling has been done yet on this claim by the present operators.

During the past year sixty cars, each containing more than fifty tons of ore, have been shipped from the property. The most of this ore came from the main Delta workings. There were ten cars from the Maxamillion vein and three cars from the Hall shaft, all of which was mined by leasers. The following tabulation gives the weight and content of the various shipments.

Lot	Dry Weight	Oz. Gold	Oz. Silver	% Copper

í.

tween the S 25-30 E vein of steep easterly dip and the S 5-10 W vein of more gentle dip easterly. It is not clear as yet which vein has had the greater movement, neither can it be determined which is the older. This zone is believed to have some possiblities above the 200 level.

Zone IV is an area of more regular conditions. It would seem that the two veins mentioned above, the S 25-30 E and the S 5-10 W veins begin to take their normal courses and they may be expected to continue with more or less regularity. Southward neither will be affected by either the "A" or the "B" fault except at very great depths. Neither of these veins have been explored to any great extent and each gives promise of an attractive volume of ore of a very good grade.

One important result of the detailed geological studies in the main Delta workings is the tentative determination of the probable position of the several veins to the north of Zone III and below the 300 level. The facts can be determined quickly at a small cost by driving a crosseut from the shaft at the 400 level, approximately S 45 W, not to exceed 100 ft. If the conclusions reached by these studies are proven a tonnage of ore at least equivalent to that originally contained to Zones I and II, above the 300 level or about 4000 tons can be reasonably expected over a similar vettical range.

Until further exploratory work is done in Zone III no positive tonnage of ore can be credited to this area. However, it is believed that this zone can furnish from between the 300 and 200 levels, not less than 2126 tons of ore with an average gold content of about 0.30 ounce per ton.

In Zone IV, there is indicated in the S 20-30 E vein between the 100 and 300 levels approximately 4200 tons of ore with a gold content of 0.858 ounce to the ton. No definite tonnage can be assigned to the S 5-10 W vein between these levels. It is interesting to note that in the drift on this vein, just begun at the 300 level there is a total width of 66 inches of "pay rock" This face sampled in four different samples shows an equated gold content of 0.571 ounce to the ton. Such width and value, if consistent for any considerable distance along the strike, will add a considerable volume to the ore reserves.

On Sketch 2 the West Delta workings are shown in some detail. On the map of Surface Geology (I) other veins, less extensively prospected but productive in a small way under leasing operations are shown. As yet not enough data are available on these occurences to make it possible to attempt any detailed description of them. However, during the past eighteen months this part of the property has produced, principally through leasing operations, approximately 1000 tons of one with a gold content above 0.50 oz. gold to the ton. Such development as there is has not reached any great depth and it is all very limited. ESTIMATED COST

PROPOSED DEVELOPMENT PROGRAM

Ø₽'

ACE MINING AND DEVELOPMENT COMPANY.

Phoenix, Arizona, August 10th, 1936

.

à

Consulting Engineer.

The Ace Mining and Bevelopment Company began operating at the Delta Mine in October 1933, and shipped the first car of ore on the lith of December of the same year. Since then operations have been carried on continuously, with the exception of the thirty day period each summer when the smelter does not receive custom ore.

Between December 1,1933 and August 1,1936 the Company shipped 120 cars of ore to the smelter. The total dry weight amounted to 5875.667 tons. The total gold content was 3497.456 owners, or an average of 0.5949 sunces to the dry ton. The total gross value of the gold alone was \$122,410.96. The combined freight and smelting charges amounted to \$45,913.10 on these shipments.

While these operations were in progress a partial study of the geology was made and a very small amount of development work was done. Certain important factors bearing on future of the property have been a worked out and a much clearer knowledge of the determining geology has been gained.

The work done to date has been of such a nature that it does not "block out" ore in the most strict application of the term but the conditions in the mine are such that an intelligent study of the present situation will indicate very clearly that a time has been reached when a more pretentious plan of operation is quite in order.

The following plan of development and expansion is believed to be warranted and it is conservative. The plan is divided into four parts:

A - B Buildings and Equipment
C Development
D Water Supply
E Mill of 50 tens daily sensity

Nyal J. Niemuth Mining Engineer Department of Mines and Mineral Resources 1502 W. Washington Street Phoenix, AZ 85007

Dear Nyal,

Enclosed for your archives is the published article I wrote on the history of mining in the South Mountains. I must apologize that the Arizona Historical Society did not credit the Department of Mines and Mineral Resources for three photographs in the article. I never saw the photo captions, so I did not know they hadn't provided the proper credits. Fortunately, the Historical Society did include my acknowledgments where you, Diane Bain, and the Department of Mines and Mineral Resources are thanked for your assistance.

Please make this article available to anyone interested in mining in the South Mountains.

Sincerely,

.") Id Bosturck

GOLD—GOLD—GOLD The Rise and Fall of Mining in Phoenix's South Mountain Park

by

Todd W. Bostwick

TARD-ROCK, OR LODE, MINING has been an important economic Hactivity in Arizona since early territorial times. Although the state is famous for its copper production, gold and silver deposits greatly influenced settlement beginning in the 1860s. By the 1890s, at least seventeen major gold mines, most of them shortlived, had been in operation in Arizona. Some of them-for example, the Vulture mine near Wickenburg-are well known, while others are long forgotten. Twenty-first century Phoenicians may be surprised to learn that for more than sixty years-from the 1880s to the mid-1940s-gold was mined sporadically inside South Mountain Park, a rugged set of ridges on the southern edge of the city. Eventually yielding more than 7,000 ounces of gold, along with lesser amounts of silver and copper, the South Mountain mines were most productive during the 1930s, at the very time that the federal government and the City of Phoenix were spending large sums of money to convert the mountains into the nation's largest municipal park. The story of mining in the South Mountains reveals some of the conflicts that arose in the West when public land was converted from mining to recreational use.¹
