## **ACCESS STATEMENT**

These digitized collections are accessible for purposes of education and research. We have indicated what we know about copyright and rights of privacy, publicity, or trademark. Due to the nature of archival collections, we are not always able to identify this information. We are eager to hear from any rights owners, so that we may obtain accurate information. Upon request, we will remove material from public view while we address a rights issue.

## **CONSTRAINTS STATEMENT**

The Arizona Geological Survey does not claim to control all rights for all materials in its collection. These rights include, but are not limited to: copyright, privacy rights, and cultural protection rights. The User hereby assumes all responsibility for obtaining any rights to use the material in excess of "fair use."

The Survey makes no intellectual property claims to the products created by individual authors in the manuscript collections, except when the author deeded those rights to the Survey or when those authors were employed by the State of Arizona and created intellectual products as a function of their official duties. The Survey does maintain property rights to the physical and digital representations of the works.

## **QUALITY STATEMENT**

The Arizona Geological Survey is not responsible for the accuracy of the records, information, or opinions that may be contained in the files. The Survey collects, catalogs, and archives data on mineral properties regardless of its views of the veracity or accuracy of those data.

RECONNAISSANCE GEOLOGY INVESTIGATION OF THE "RICH" LODE MINING CLAIMS (Cu), ABOUT 1 MILE NW OF RAWHIDE MINE, ARTILLERY PEAK MINING DISTRICT, MOHAVE COUNTY, ARIZONA.

As engaged by the Storing-Curtis, Inc., company, Box 908 Wikieup, Arizona, 85360, Kinnon & Associates, Engineering Consultants of Wickenburg, Az. made a reconnaissance geology survey of the "Rich" lode claims on July 16, 1981. The undersigned, acting for Kinnon & Associates, made the examination. He was accompanied by Myron E. Storing, an official of the Storing-Curtis company. They consist of six (6) unpatented mining claims and they are in Section 12, T-11-N, R-14-W, G&SR B&M (see attached maps). These claims are North of Almo Lake, on a pediment of the Raw Hyde mountains. The claims have copper showings and are in the Artillery Peak Mining District. The claims appear to be well monumented and posted.

GEOLOGY:

As mentioned, these claims are on a pediment of the Rawhyde mountains, which are primarily Redwall Limestones (Mississippian) and Martin Limestones (Devonian in age), with tertiary volcanics in some portions of the upper stratigraphy. The claims are in Quarternary sedimentary alluviums, and the copper appears in a volcanic structure, in this detrital matrix. In places, this copperiferous bearing silicious rock formation has a width in excess of one hundred fifty (150) feet, but it narrows down greatly in places, along its length. The surface exposures can be seen for at least fifteen hundred (1500) feet (length). The depth is fairly shallow, and the whole exposure could be called tabular. It could be a series of lenses, but this would have to be confirmed by more exploration work. The proposed ore body strikes about East to West, and dips to the North at about 20 degrees. Two old bulldozer cuts show about a six (6) feet exposure of the copperiferous rock. Megascopic examination shows Cuprite, malachite, and some tenorite. It also contains some psilomelane (manganese) particles. It is considered that this mineralization occurred from super hot vapors and gases during the Larimide revolution (Tertiary to Late Cretaceous periods). This is called Hypogene action.

Apparently this copper showing location has been seriously investigated in the past, by groups who purportedly had control of the property, then. This would be about ten(10) or fifteen (15) years ago. Some old records were shown the writer that drilling there, was accomplished under the direction of <sup>DERMAN</sup> Mike O'Leary, Mining Engineer, Wickenburg, Arizona. The results show that the copper deposits are shallow. It might be well to point out that all of the giant copper companies, mine Cu, at grades lower than those at the "Rich" claims (or what the writer assumes the grade to be at this time). But the mentioned companies have mountains of copper available, thousands of times larger than the Rich claims. In the writers opinion, none of these companies would be interested in acquiring the mentioned claims (the apparent deposits are too limited).

A chip channel cut sample was taken from an outcrop of this tabular copper formation, about fifteen hundred (1500) East of adjoining Centennial/wash. Results of the assay are:

<u>Au</u> (troy oz/ton)	<u>Cu</u> (percentage per ton)
Trace	5.48 %

#### CONCLUSION.

The sample outlined above, turned out unusually high in copper, with oly a trace of gold.

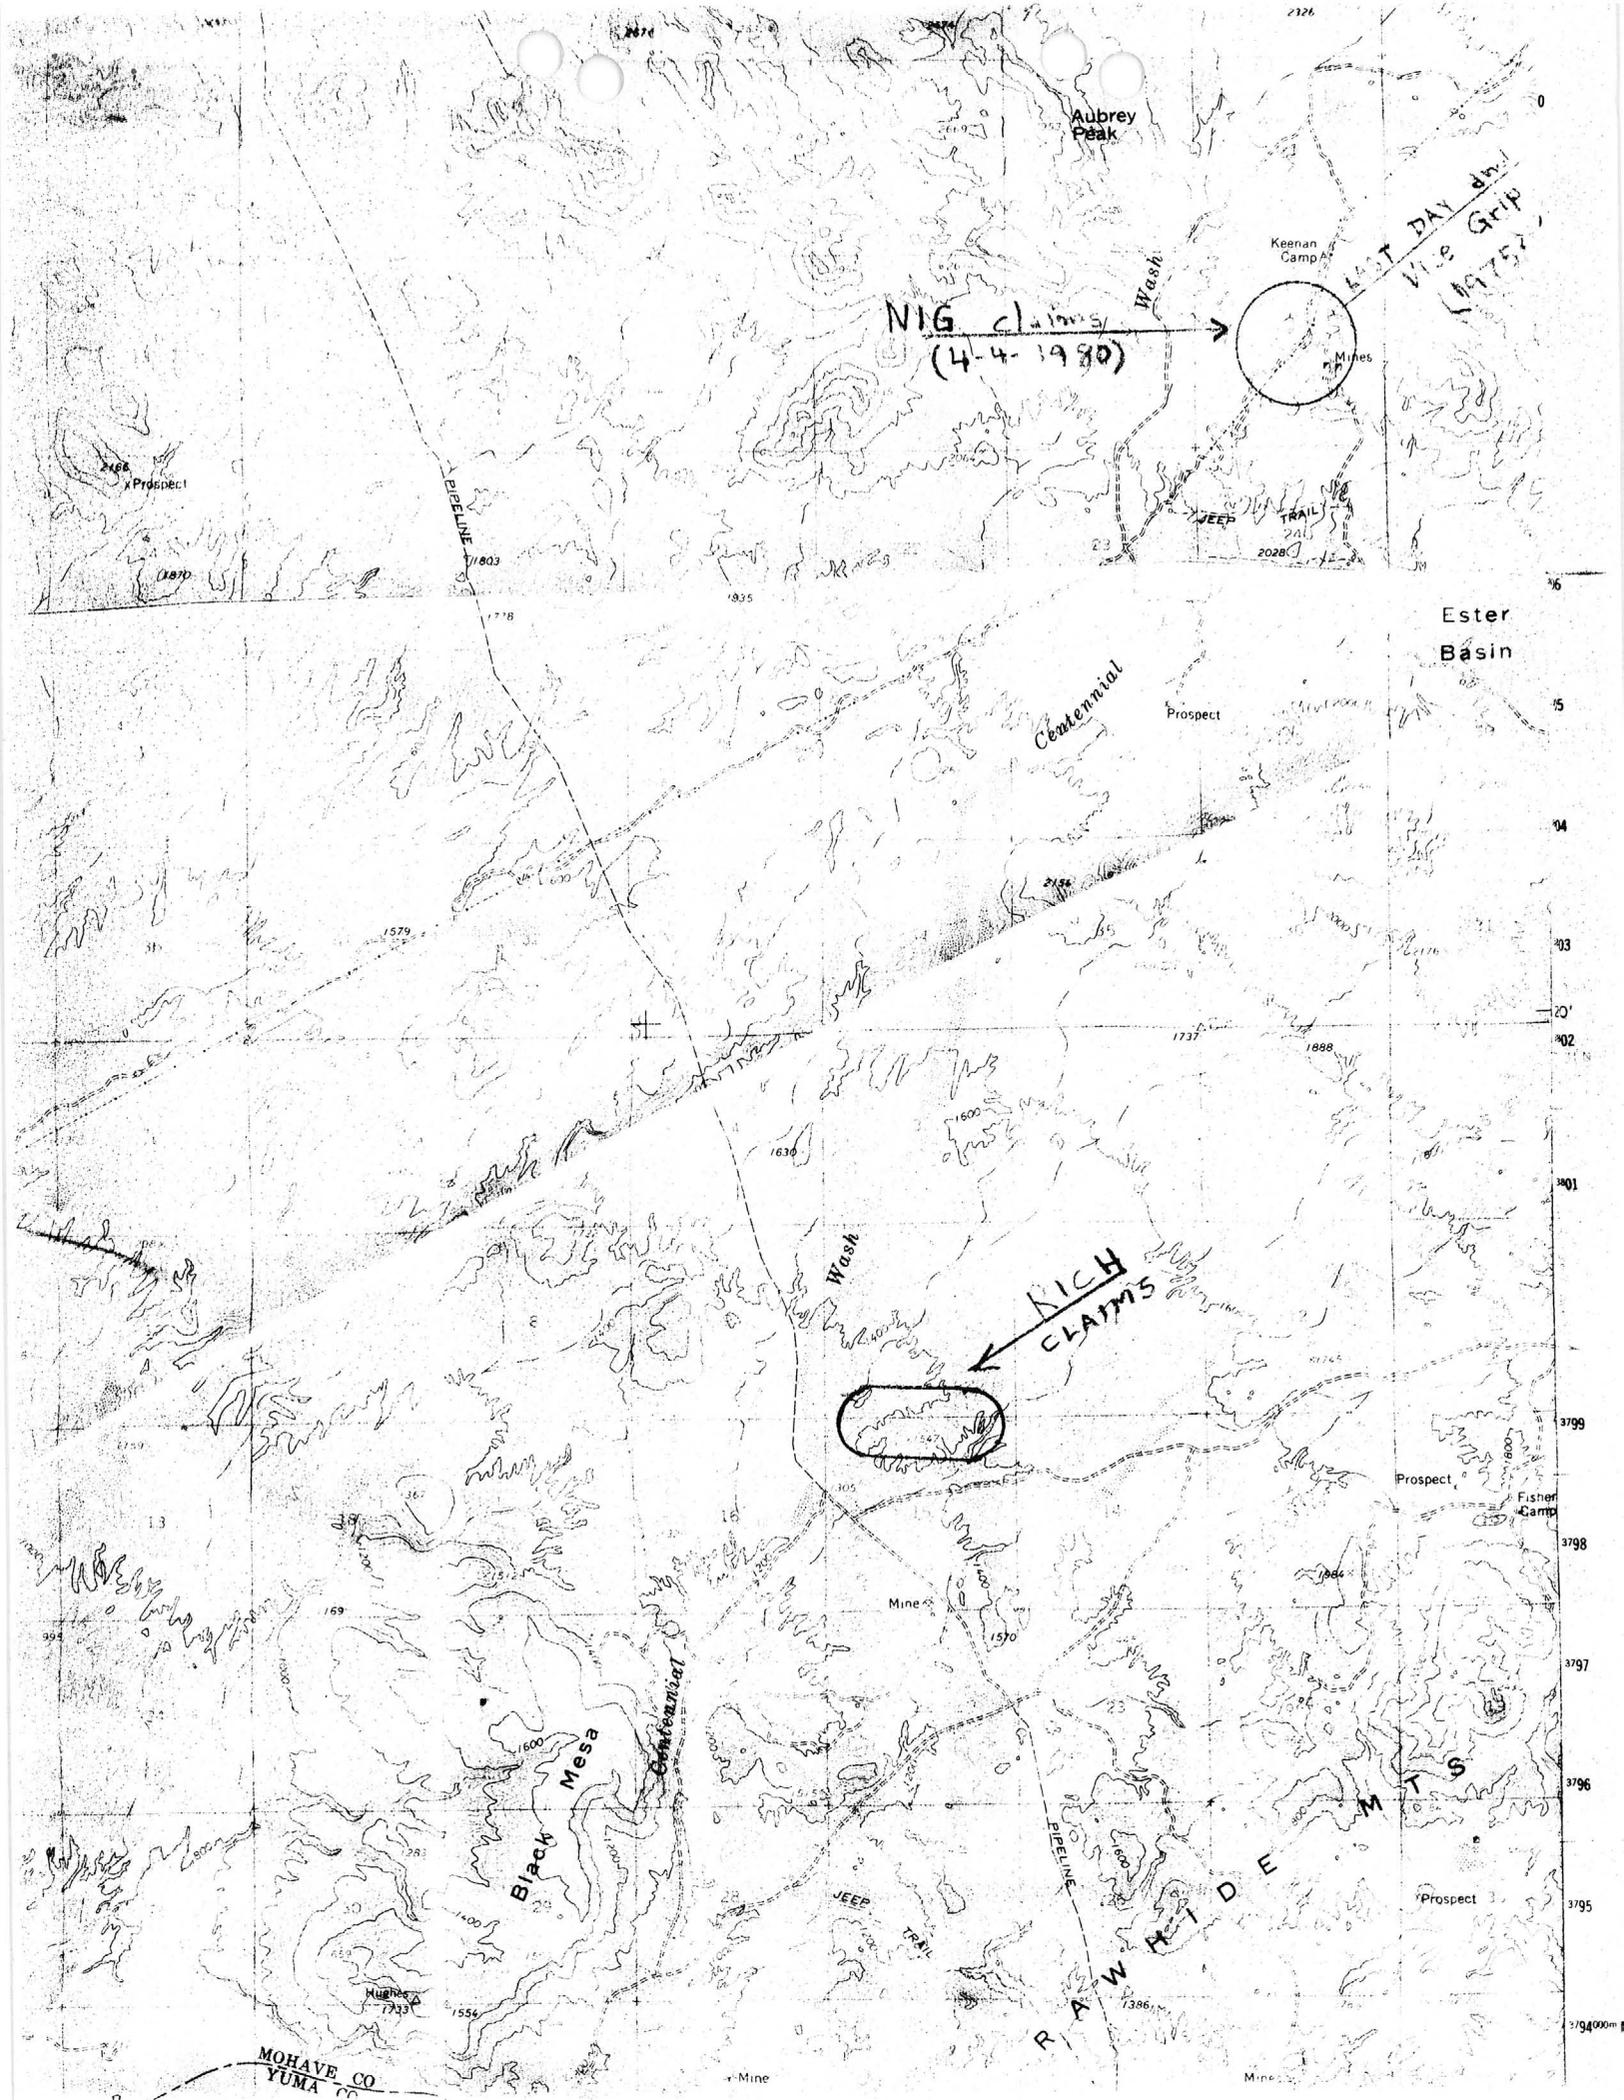

However, the undersigned, examined an old report dating from about eight (8) years ago on this property, which shows the copper as running from 0.50% to 1.0%, only.

Suggest the taking of many, many samples on the Rich claims (across the depth of the vein). If the average is 2.0% Cu, or higher, then consideration could be given to a small two (2) man operation of a leaching plant. This also, providing water can be obtained locally in sufficient quantities for such an operation.
