

NOTES

1. Areas 1 - 10 show high gamma relief and further geologic reconnaissance should be considered.
2. Areas 2, 4, 5, may be an extension of the same structure and further magnetic coverage is recommended (EE', FF') pending results of geologic investigation.
3. Area 11 is probably a result of surface rock type and identification of this may aid interpretation of other magnetic highs.
4. Areas 6 and 8 show magnetic lows, as well as highs, and should be checked for hydrothermal alteration.
