Special Report Number 14

By
Richard R. Beard, Mining Engineer
February 1989

ACKNOWLEDGEMENT

The author wishes to express his sincere appreciation to the management and staff of each of Arizona's mining companies for graciously devoting time and effort to provide information for this report during this period when the survival of their industry requires their constant attention.

Lorraine Burgin of the U.S. Bureau of Mines, Dr. George Leaming of the Western Economic Analysis Center of Marana, Arizona and the American Bureau of Metal Statistics, Inc. of Secaucus, New Jersey also provided vital information.

Thanks are also due to the Arizona Department of Economic Security, the Arizona Department of Revenue and the staff of the Joint Legislative Budget Committee for providing statistics and data.

A special gratitude is felt toward the preceding authors for providing the format and sources of statistical information and to Leroy E. Kissinger, Director of the Department of Mines and Mineral Resources for providing the opportunity to author this report.

INTRODUCTION

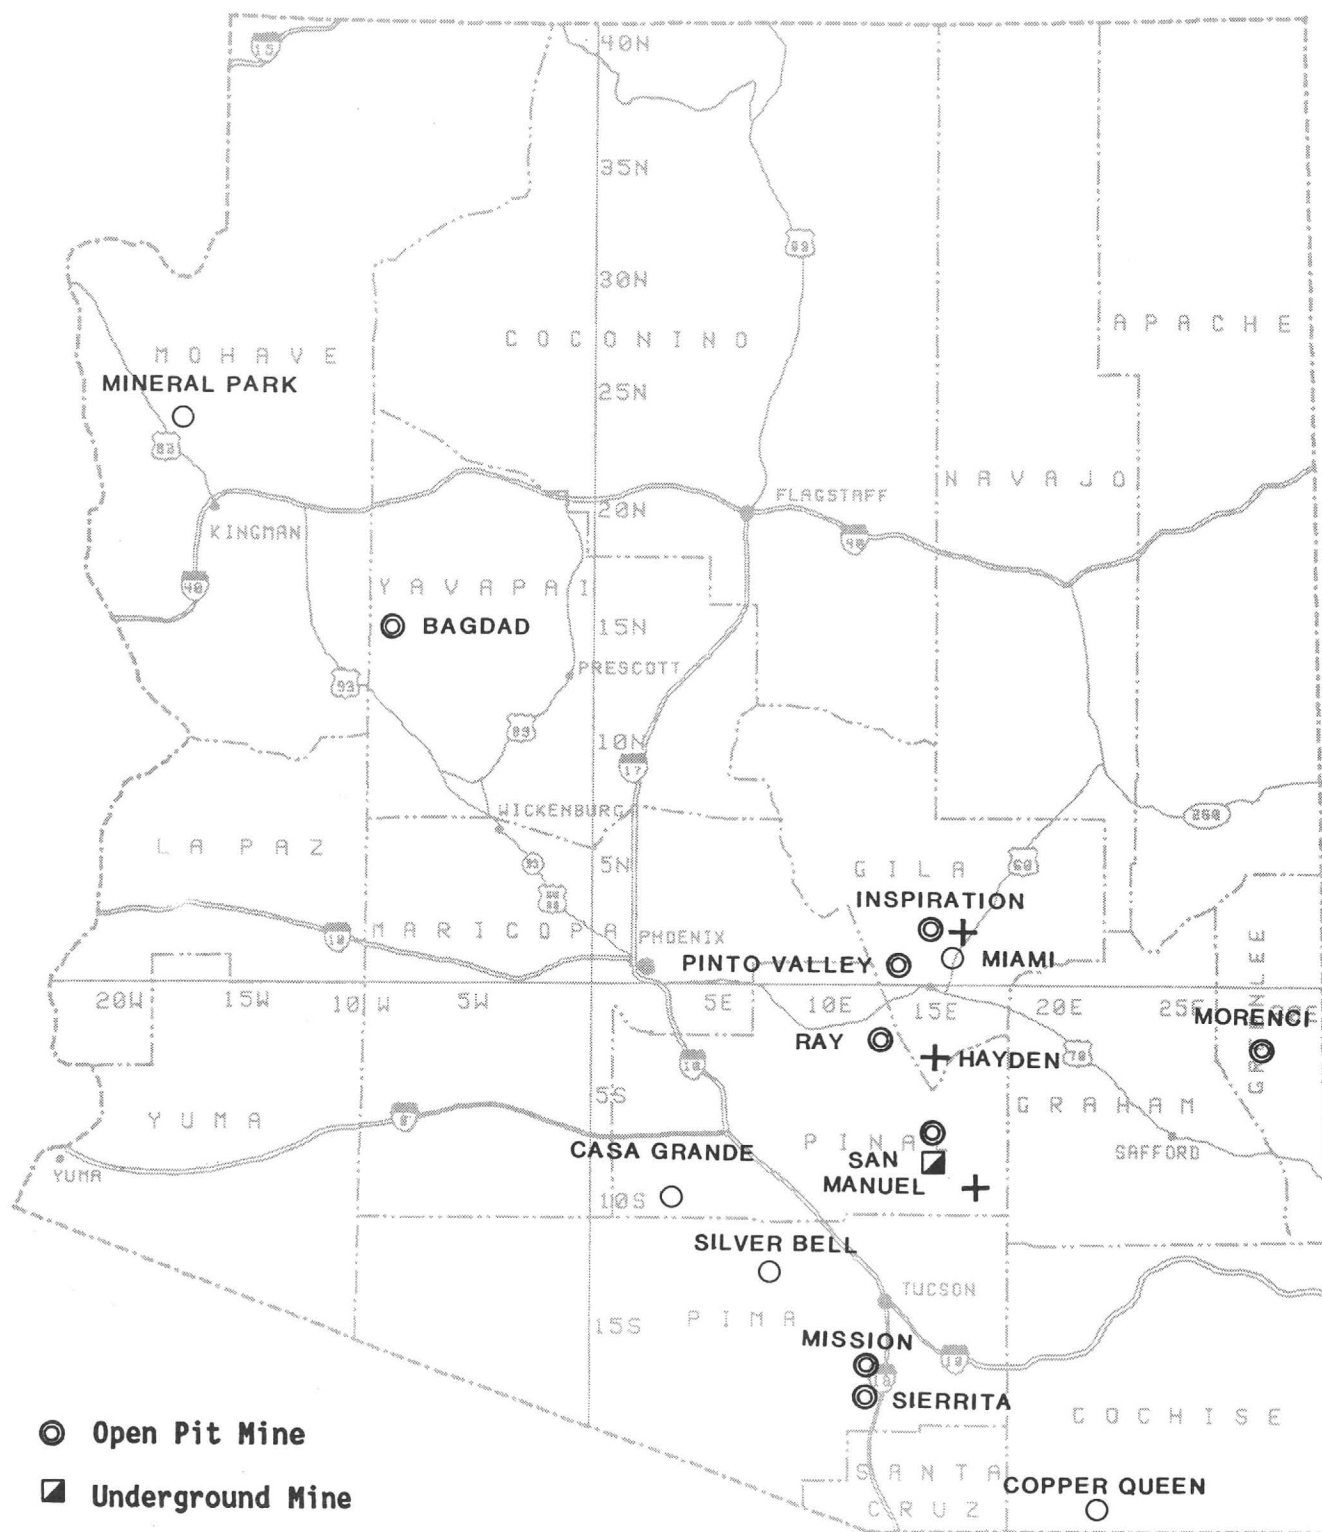

The Arizona Department of Mines and Mineral Resources presents herein a report covering activity in Arizona's copper industry in the calendar year 1987. A brief review of operational highlights reported by the major developers and producers in the State, market and price developments that affected copper production and discussions of Arizona severance taxes on metalliferous minerals are included.

The contained statistical tables include various production, employment, inventory, import/export, prices, costs and ore reserve numbers for 1987. Production of recoverable copper is given for individual mines and by company. Figures showing the importance of copper in the mining industry are provided, as are data on the by-products of copper mining; gold, silver and molybdenum. In addition, historical compilations are included for leach copper, average grade of ore produced, percent copper recovered, open pit mine stripping ratios, and employment and earnings. Additional compilations indicating refined copper inventories in and out of the United States and average copper prices by month from 1978 through 1987 are provided. Also included are tables showing designed mine capacity and copper reserves in Arizona plus average copper cash production costs for the United States, 1982-1986.

The Department maintains extensive reference libraries in its Phoenix and Tucson offices concerning the copper industry in Arizona. These repositories include information on individual mines and mining companies, United States Bureau of Mines and United States Geological Survey publications, other professional publications and periodicals and earlier editions of this report. Additionally, experienced mining engineers are available for consultation, at no charge, on matters germane to the minerals industry. Office hours are 8 a.m. to 5 p.m. on all non-holiday weekdays.

COPPER PRODUCTION IN ARIZONA - 1987

Arizona's copper industry produced 862,034 tons of copper in 1987 (Table I). This is a decrease of 1.6% below 1986 and 19.6% below the record production of 1981 (Table IX). Arizona's share of the United States total was 61.4% (Table XXIV).

The gross value of non-fuel mineral production in Arizona in 1987 was up 13% over 1986 to \$1,783,380,000 (preliminary) (Table X). Copper production represents 76% of this total and the by-products of copper production (gold, silver and molybdenum) represent an additional 5.4% (Table IX). The total contribution of the copper mines was therefore 82.3% of the gross value.

Copper was produced by 5 companies from 12 properties in 1987 and molybdenum was recovered as a co-product or by-product at 5 of these properties (Tables III & IV). Eight properties produced 98.6% of Arizona's copper and 3 produced 93.7% of the molybdenum. The Morenci-Metcalf mine of Phelps Dodge led in copper production with 30.8% of the total and the Sierrita-Esperanza complex produced 57.2% of the molybdenum.

More than 170,000 tons of copper representing 19.8% of the total was produced by leaching in 1987. Solvent extraction-electrowinning produced almost 135,000 tons of cathode copper from these leach solutions. The remaining 36,000 tons were precipitated as cement copper (Table I).

Stripping of waste, including some leachable material, was accomplished at the 8 operating open pit mines during 1987. The weighted average of the stripping ratios - waste to ore - was 1.21 to 1 (Table VIII). This is an increase from .96 to 1 in 1986 that probably indicates normal long range mine planning.

The weighted average grade - percent copper - of sulfide ores mined in 1987 was .58% copper (Table VI). This is lower than the average of the last 10 years and reflects the confidence of the copper industry.

The estimated capacity to produce copper at each of Arizona's principal operations totals 1.042 million tons annually (Table XI). By this estimate the mines, concentrators and leach facilities operated at 83% of capacity in 1987.

The copper reserve base in Arizona by company and property is estimated in Table XIII. The reserve base as defined in "Mineral Facts and Problems" 1985 Edition, Bureau of Mines Bulletin 675, page 3, includes those resources that are currently economic (reserves), marginally economic (marginal reserves) and some of those that are currently sub-economic (sub-economic reserves). The many technical, political, social and economic variables render a listing of actual economic reserves inappropriate.

1987 OPERATIONS SUMMARY

Operating Properties	12
Operating Companies	5
Operating Smelters	3
Ore Mined (Includes some oxide)	166,113,000 tons
Ore Milled (sulfide)	146,016,000 tons
Waste/Overburden Removed (includes some leach material)	182,460,000 tons
Average Stripping Ratio	1.21:1
Copper Produced	862,034 tons - 61.4% of U.S.
From Sulfide Ores	691,113 tons - 80.2% of AZ
Average Grade	.58% copper
From Leaching	170,921 tons - 19.8% of AZ
SX-EW	134,953 tons - 79.0% of Leached
Precipitation	35,968 tons - 31.0% of Leached
Molybdenum Produced	25,861,000 pounds
Silver Produced	3,217,000 troy ounces
Gold Produced	48,991 troy ounces
Average Employment	10,340
Average Annual Wage	\$28,946
Productivity	120 pounds of copper per man-hour
	11.5 tons of ore per man-hour

STATUS AND PROGRESS

In 1987 the trends started in 1985 and pursued through 1986 continued. At the start of the year the price remained low and the only hope for survival appeared to be cost reduction. The continued decrease in stocks had little effect on the price until it became apparent that there was no excess production capacity that could be brought on line quickly. By the end of the year the price was well over a dollar a pound and seemed to be stabilizing. Although high prices were welcome they elicited no rush to develop any major new domestic properties because of the planned expansion of foreign production. Such projects as the Escondida porphyry in Chile which is expected to add over 300,000 tons of copper to the market in 1991, among others, keep the domestic producers conservative. Meanwhile 1988 appears destined to be a banner year.

No producing properties were shut down in 1987, nor were any developed or reactivated. Virtually all, however, were able to establish long term mining plans with some degree of confidence.

OPEN PIT MINING

The majority of the copper is produced by open pit mining methods. So far most of the improved efficiency has been the result of consolidation, preplanned maintenance, scheduling and utilization of equipment. The computer dispatching at Morenci is but one example of this. Now, however, major changes in operating methods are being considered.

At Morenci, Phelps Dodge has gone from an all rail haulage system to a system using trucks to service the shovels and haul to in-pit transfer points for rail haulage to the concentrators and distant dumps. With the purchase of the conveyor system from Anamax's closed Twin Buttes mine, rail haulage will be phased out completely.

Magma has brought its open pit mine for the oxide ore overlying the main sulfide orebody at San Manuel on line and it is now in production.

Cyprus has acquired Duval's properties and is increasing production at the Sierrita-Esperanza property to add to its continuing production at Bagdad.

Asarco purchased the Ray Mines Division from Kennecott to supplement its in-house production of concentrates to feed its Hayden Smelter.

UNDERGROUND MINING

At San Manuel, the only operating underground copper mine in Arizona, Magma is showing signs of optimism by continuing to invest in the development of the Kalamazoo ore body. Development of Asarco's underground ore body at Sacaton and Phelps Dodge's Safford property has been suspended indefinitely and no other underground development is under consideration in Arizona.

STATUS AND PROGRESS (CONT)

IN-SITU MINING

In-situ leaching of rubbleized copper bearing material remaining in mined out underground stopes has long been practiced in Arizona. At San Manuel, Magma is developing a more formalized program of leaching mined out block caving stopes and is approaching production status. During the last few years all of the production from the Lakeshore property has been from a similar system developed by Noranda. Cyprus is continuing this project as well as the tests initiated by Noranda into in-situ leaching of non-rubbleized or virgin ground. Kocide Chemical is also planning to produce copper from the Van Dyke property at Miami in this fashion, taking advantage of the test work conducted by Oxymin.

The U.S. Bureau of Mines is funding tests of in-situ leaching of virgin ground in Arizona. Science Applications International Corporation has been awarded a contract to identify analytical procedures and develop computer algorithms that could be used to select the best in-situ mining method for any specific copper oxide deposit. Cyprus is cooperating in this study at Cyprus Casa Grande (Lakeshore) and Asarco is cooperating at the Santa Cruz property near Casa Grande. The Santa Cruz ore body is a deep seated oxide deposit which is owned by Asarco and Freeport McMoran on a 50-50 basis.

CONCENTRATION

The overwhelming majority of copper mineralization in Arizona is of the sulfide type and is not amenable to leaching without extraordinary means. Inspiration has had success with its heap leach-ferric cure process on mixed oxide-sulfide ores and Kennecott pioneered the use of bacteria to convert sulfides to oxides in low grade dumps. However, as shown in Table I, about 80% of the copper was produced by the flotation method of concentration. In addition much of the leached copper produced is from dumps of "waste" which was stripped from open pit mines to provide access to sulfide ore. Another aspect of the flotation process that makes it viable at some properties is the recovery of molybdenum by selective flotation. Molybdenum provides a significant portion of the revenues from some properties. Also, any precious metals in the ore follow the copper through the flotation process and smelting to the electrolytic refinery where they can be recovered from the anode slimes.

There are currently 8 flotation concentrators in operation in Arizona. Asarco is operating 2 - Ray and Mission, Cyprus is operating 2 - Bagdad and Sierrita, Magma is operating 2 - San Manuel and Pinto Valley and Phelps Dodge is operating 2 at Morenci-Metcalf. Five are on standby. They are Asarco's at Silver Bell, Cyprus' at Mineral Park and Esperanza, Inspiration's at Miami and Phelps Dodge's at Ajo.

Although efficiency is constantly being improved, the flotation process is not cheap. It requires crushing and grinding the ore, separation of the ore minerals from the gangue minerals in the flotation cells, smelting the concentrate and refining the copper anodes from the smelter. The most significant development in flotation is the column flotation cell being installed in most concentrators.

STATUS AND PROGRESS (CONT)

SOLVENT EXTRACTION

Traditionally the copper produced from leach solutions has been extracted by the cementation process (precipitation from solution by the replacement of copper in solution by metallic iron). This has been a source of relatively cheap copper but the cement copper produced must be smelted and refined along with the flotation concentrates.

During the 60's Ranchers Exploration and Development Corporation pioneered the use of solvent extraction-electrowinning to produce copper from its Bluebird property near Miami. The obvious advantage of this method is that cathode copper of salable quality can be produced directly from leach solutions. Smelting, with its pollution problems, and further refining are therefore not required.

During the relatively good years experienced by the industry after Ranchers' introduction of solvent extraction-electrowinning, interest in the process grew gradually. The disastrous 80's have prompted an accelerated interest in it, however. Nine plants operated during 1987, one was moved from Cyprus Johnson to Cyprus Sierrita and the plant at Morenci came on line. Several expansions or new plants are planned and the cementation process is being phased out except as a subsidiary method.

SMEETING

Of the 6 smelters remaining in Arizona in 1987 only 3 operated. Asarco's Hayden smelter and Inspiration's smelter at Miami have been brought into compliance with air pollution constraints and Magma's smelter at San Manuel is being retrofitted with an Outokumpu flash furnace to bring it into compliance. The Ray smelter at Hayden that Asarco acquired from Kennecott met all significant environmental constraints when last operated in 1982 and is available if needed. Phelps Dodge's smelters at Ajo and Morenci will require extensive retrofitting before they can be operated and their smelter at Douglas has been permanently shut down in lieu of retrofitting. Phelps Dodge is shipping concentrates to its Hidalgo smelter at Playas, New Mexico and to the Chino smelter at Hurley, New Mexico that was recently acquired from Kennecott. Excess concentrates are being sold.

As an alternative to smelting, Cyprus Casa Grande is planning to reactivate the Roast-Leach-Electrowinning (RLE) plant built by Hecla at the Lakeshore property. In this process flotation concentrates are roasted to make them acid soluble, leached with sulfuric acid and salable cathode copper is extracted from solution by electrowinning. Acid is produced from the roaster gases and the process is essentially pollution free. A portion of the concentrates from Sierrita will be processed at this plant.

PROGNOSTICATION

An advantage of publishing the 1987 report so late, for which I apologize, is that hindsight can be used to produce the 1988 "forecast". I will not take advantage of that but will instead try my luck at forecasting 1989.

STATUS AND PROGRESS (CONT)

Suffice it to say that 1988 brought broad smiles but furrowed brows to the industry. While the high prices of copper being experienced bring welcome relief, they also raise the spectre of "substitution". Once a market is lost to another commodity, it is very difficult to reclaim. However, with the predicted demand, the current worldwide production capacity and the expected expansion of that capacity over the next few years, the price of copper should remain at a level that is not conducive to substitution. Any upset in the world economy whether inflationary or recessionary will bring difficult times back to the industry, however.

ASARCO INCORPORATED

Corporate Headquarters - 180 Maiden Lane, New York, New York 10038 - Phone (212) 669-1000

Tucson Office - 1150 N. 7th Ave., P.O. Box 5747, Tucson, Arizona 85703 - Phone (602) 792-3010

The Tucson office houses the Southwest Mining Department, the Mining Department/Corporate Office, the Mineral Beneficiation Department, the Exploration Department, the Acid Sales Department and the Department of Safety and Technical Employment.

During 1987 Asarco's Arizona operation consisted of a major copper smelter at the Hayden Unit 2 major open pit mines at the Mission and Ray Units and a dump leaching/cementation operation at the Silver Bell Unit. Asarco now produces 60% of the feed to its smelters and with the increased production at the Mission complex it will be able to produce 67%.

Asarco and Freeport McMoran, its partner in the Santa Cruz deposit seven miles west of Casa Grande, will participate with the U.S. Bureau of Mines in an in-situ leaching experiment. This large deep seated deposit will be used to determine the feasibility of in-situ leaching of undisturbed virgin ground and to develop a data base for application to other suitable deposits. Hydrologic studies will be followed by the design and development of the leach field and the design of the pilot solvent extraction-electrowinning (SX-EW) plant.

Asarco also holds major reserves at the Chilito north of Hayden, at Helvetia, east of the Mission Complex and at Sacaton East.

In 1987 Asarco continued its corporate restructuring and cost reduction programs and has begun to realize the benefits. The consolidation and additional reserves at the Mission Complex, the modernization at Ray and the acquisition of the Helvetia reserves places the company in a strong competitive position.

Hayden Unit - Box 98, Hayden, Arizona 85235 - Phone (602) 356-7804

The Hayden Unit consists of an INCO flash furnace smelter rated at 940,000 tons of charge per year for an estimated production of 175,000 tons of blister copper. An acid plant rated at 2,800 tons of sulfuric acid per day keeps sulfur dioxide emissions within air quality restraints.

Although with the acquisition of Ray and the increased production at Mission, Asarco will provide about two thirds of its smelter feed, the company will still fill its traditional role as a custom and toll smelting company. The capacity at the Ray smelter is available if needed.

Mission Unit - Box 111, Sahuarita, Arizona 85629 - Phone (602) 791-2920

The Mission Unit consists of the consolidation of the Mission, Eisenhower, San Xavier, and Pima open pit mines into one large open pit

ASARCO INCORPORATED (CONT)

referred to as the Mission Complex. Also included is the smaller San Xavier North pit. The acquisition of the rest of the Eisenhower in April and of the Mineral Hill deposit adjacent to the Pima section of the open pit late in 1987 increased reserves and facilitates further efficiencies in pit design and mine planning.

Mining is conducted by electric shovels with truck haulage to the primary crusher and waste dumps. Some areas of the pit are back to final limits allowing some waste dumping in pit. The stripping ratio in 1987 was 1.05:1, waste to ore.

The concentrator capacity is being increased from 29,000 tons per day to 41,000 tons per day. This is being accomplished by lengthening the 10.5 foot diameter ball mills from 15 feet to 18 feet, installing 2 new ball mills salvaged from the Sacaton mill, converting some of the cleaner flotation cells to roughers and installing six 8x52 foot column flotation cells for cleaners.

Ray Unit - P.O. Box 9, Hayden, Arizona 85235 - Phone (602) 356-7811

The Ray Unit consists of an open pit mine, dump leach and heap leach operations and a SX-EW plant at Ray and a 26,000 ton per day concentrator at Hayden. The 400,000 ton per year smelter and 900 ton per day acid plant at Hayden are on stand-by status.

Mining is conducted by electric shovels supplemented by front-end loaders utilizing truck haulage. The production rate is 100,000 tons per day of which 26,000 tons are sulfide ore sent to the mill, 10,000 tons are silicate ore which is crushed and sent to the leach heaps and the remainder is low grade sent to leach dumps or waste sent to waste dumps. The mine plans are predicated on the sulfide operation and therefore silicate ore is stockpiled when in excess and fed from the stockpile to the crushers when short.

Sulfide ore is hauled to the primary crusher at Ray where it is crushed and transferred to trains for the 20 mile haul to the mill.

Silicate ore is hauled to the primary crusher then further reduced to minus 3/4 inch by secondary and tertiary crushers. It is then transported by conveyor where it is agglomerated with sulfuric acid while in transit to the heap leach area. Final haulage and placement on the heaps is by end-dump trucks.

Low grade muck is hauled to prepared leaching areas and non-mineral muck is hauled to waste dumps by end dump trucks. All leach solution are now fed to the SX-EW plant.

Previously stockpiled native copper ore is being reclaimed and fed to the mill in small proportions as is smelter slag.

New tailings dams are being built on the west side of the Gila River across from the present tailings dams.

ASARCO INCORPORATED (CONT)

Silver Bell Unit - Marana, Arizona 85653 - Phone (602) 622-6551

The Silver Bell Unit consists of an open pit copper mine and an 11,000 ton per day concentrator that are both on stand by status. The dump leaching operation and precipitation plant are in operation.

CYPRUS MINERALS COMPANY

Corporate Headquarters - 9100 E. Mineral Circle, P.O. Box 3299, Englewood, Colorado 80112 - Phone (303) 643-5000

Cyprus has continued to grow. In July of 1987 it added Noranda's Lakeshore property south of Casa Grande as Cyprus Casa Grande. In March 1988 they entered into a 15 year lease of the Twin Buttes property formerly operated by Anamax and in July 1988 they acquired the entire Inspiration property at Miami including the mines, concentrator (inactive), SX-EW plant, smelter, acid plant, electrolytic refinery and rod plant. Cyprus was the third largest producer of copper in 1987 and with the new acquisitions it should move into the second position. It will continue to be the largest producer of molybdenum.

In addition to its copper-molybdenum properties, Cyprus operates Arizona's largest gold mine, the Copperstone north of Quartzsite, and has entered into a joint venture agreement with Magma to explore the old Mammoth mine, which is a part of Magma's San Manuel property, as a possible gold operation. Cyprus would be the operating partner.

Cyprus Bagdad - P.O. Box 245, Bagdad, Arizona 86321 - Phone (602) 633-2241

The Bagdad operation consists of an open pit copper-molybdenum mine, a 54,000 ton per day concentrator, a dump leach operation and an SX-EW plant. Copper concentrates were shipped to Inspiration, Magma and Japan during 1987 and the SX-EW cathodes and molybdenum oxide are sent directly to market.

Mining is conducted by electric shovels using truck haulage to the primary crusher and dumps. The stripping ratio in 1987 was 0.77 to 1, waste to ore.

The sulfide ore is transported from the primary crusher at the mine, a distance of 6,400 feet to the coarse ore stockpile at the concentrator, by conveyor belts. There it is crushed further, ground by autogenous and ball mills and copper and molybdenum concentrates are produced. Column cells are utilized in the molybdenum flotation circuit.

Dual process ore (sulfide ore with an unusually high oxide content) is placed in heaps and leached for 60 days before being sent to the concentrator.

Pregnant solutions from the leach dumps are collected behind dams and pumped to the SX-EW plant at approximately 1.8 grams of copper per liter. The barren solutions are returned to the dumps after the copper has been extracted.

Cyprus Casa Grande - P.O. Box C-9, Casa Grande, Arizona 85222 - Phone (602) 623-1539

The Casa Grande operation consists of an in-situ leaching operation and an SX-EW plant. The block caved stopes in the oxide orebody are being leached and development of a leaching operation in virgin ground is underway using

CYPRUS MINERALS COMPANY (CONT)

high pressure pumps to inject sulfuric acid solution into holes drilled from the old underground workings. Pregnant solutions are collected in sumps underground and pumped to the SX-EW plant.

The roasters and acid plant of the Roast-Leach-Electrowinning (RLE) plant built by Hecla have been refurbished and should be in operation in 1988. Cyprus plans to treat concentrates from Sierrita at the plant. The pregnant solutions will go to the SX-EW plant and the acid produced from the roaster gases will be used for the leaching operations.

Cyprus Mineral Park - P.O. Box 6249, Kingman, Arizona 86401 - Phone (602) 565-2226

The Mineral Park property consists of an open pit copper-molybdenum mine and a 15,000 ton per day concentrator which are both on stand by status. The dump leaching operation and the precipitation plant are in operation and some in-pit leaching is also being conducted.

Cyprus Sierrita - P.O. Box 527, Green Valley, Arizona 85622 - Phone (602) 791-2950 & (602) 625-4800

The Cyprus Sierrita property consists of an open pit copper-molybdenum mine, a 100,000 ton per day concentrator, a ferromolybdenum plant, a rhenium plant, a dump leaching operation, precipitation plant and an SX-EW plant. The Esperanza pit and 17,500 ton per day concentrator were inactive during 1987 with the exception of the crushers that were used to supplement the Sierrita mill crushers.

Mining is conducted using electric shovels and truck haulage to the crushers and dumps. The stripping ratio in 1987 was 0.40:1, waste to ore. Dump leaching and precipitation began in the early 1960's.

When production ceased at Johnson Camp the SX-EW plant was moved to Sierrita to replace the precipitation plant. Lead anodes, titanium cathodes, extractants and other equipment and reagents were brought from Battle Mountain and Anamax to complete the installation and startup.

INSPIRATION RESOURCES CORPORATION

Corporate Headquarters - 250 Park Avenue, New York, New York 10197 - Phone (212) 503-3100

Inspiration Consolidated Copper Co. - P.O. Box 4444, Claypool, Arizona 85532
- Phone (602) 473-7006

The Inspiration properties consist of 3 open pit copper mines collectively called Inspiration Mines, a 24,000 ton per day concentrator which is currently on standby status, a 380,000 ton per year electric furnace smelter, acid plant, SX-EW plant, electrolytic refinery and a 135,000 ton per year rod plant.

The ore is mined at the rate of 93,000 tons per day with electric shovels and hauled by truck to high grade, low grade and waste dumps. The stripping ratio in 1987 was 2.04:1, waste to ore. Leach solutions from the low grade dumps are acidified and passed through the high grade dumps to produce a pregnant solution containing 5.6 grams per liter of copper to feed the SX-EW plant. The solvent extraction plant is being doubled in size from 4500 to 9000 gallons per minute to permit the use of lower grade solution without decreasing production.

Essentially all feed to the smelter is either purchased or tolled material. In 1987, 350,000 tons of concentrates and 67,000 tons of precipitates were treated. Custom anodes are cast to shapes required by customer.

The tank house has a combined capacity of 85,000 tons per year of electrowon and electrolytically refined copper and is being expanded to 107,500 tons per year. Cathodes from both sections are fed to the continuous cast rod plant to produce 5/16" copper rod on reels holding three and one-third miles of rod each.

The Reymert mine west of Superior was operated for smelter flux and contributed 347,000 ounces of silver in 1987.

In July of 1988, Cyprus purchased all of Inspiration's copper properties, plants and equipment to operate under the name of Cyprus Miami.

MAGMA COPPER COMPANY

Corporate Headquarters - P.O. Box M, San Manuel, Arizona 85631 - Phone (602)385-3100

In March 1987 after nearly 20 years as a wholly owned subsidiary of Newmont Mining Corporation, Magma once again became an independent corporation. As such it has continued implementing an extensive expansion and modernization program to meet all environmental constraints and to become competitive in the copper market. As part of this program the company housing in the town of San Manuel is being sold.

Magma's operations are divided into the San Manuel Division and the Pinto Valley Division including the Pinto Valley Unit and the Miami Unit. The original Magma Mine at Superior was closed in 1982 and remains inactive.

Magma also operates a 29 mile railroad from San Manuel and a 28 mile railroad from Superior. Both connect to the Santa Fe Southern Pacific system.

San Manuel Division - P.O. Box M, San Manuel, Arizona 85631 - Phone (602) 385-3100

The San Manuel Division consists of a block-caving underground copper-molybdenum mine, a 62,000 ton per day concentrator, an open pit oxide copper mine, pad leach, in-situ leach, SX-EW plant, an 800,000 ton per year smelter with a 2000 ton per day acid plant and a 300,000 ton per year electrolytic refinery and a 150,000 ton per year rod plant.

After development of the grizzly and haulage levels, caving is initiated by undercutting the ore block. The caved ore is drawn through the grizzlies to the haulage level. Haulage to the production shafts is by 23 ton trolley locomotives pulling ten 15-17 ton ASEA cars or fifteen 12-13 ton rotary dump cars. After hoisting to the surface the ore is hauled by rail to the mill in 100 ton cars in groups of 35 to 40 pulled by 125 ton diesel-electric locomotives.

The 62,000 ton per day concentrator is being modernized by installing larger but fewer cyclones, by replacing controls with programmable controllers, by replacing small flotation cells with nine 2000 cubic foot Maxwell cells and seventy-two 300 cubic foot machines in the rougher circuit and by replacing conventional cells with column cells in the cleaner circuit.

At the smelter the reverberatory furnaces are being replaced with an Outokumpu Flask Smelting Furnace. At a design capacity of 3000 tons of concentrate per day, it will be the largest single furnace smelter in the industry. An oxygen plant and modifications to the acid plant are a part of the modernization.

Mining at the Open Pit Oxide Mine is accomplished with hydraulic excavators and front end loaders and truck haulage to the polyethylene lined leach dumps. Copper is recovered from the leach solutions at the SX-EW plant which uses the ISA process of plating the copper on stainless steel sheets rather than on copper starter sheets.

MAGMA COPPER COMPANY (CONT)

Cathodes from the electrolytic refinery and the SX-EW plant are melted and cast into continuous rods at the rod plant.

Pinto Valley Division - P.O. Box 100, Miami, Arizona 85631 - Phone (602) 425-7611

The Pinto Valley Division consists of the Pinto Valley Unit and the Miami Unit. At the Pinto Valley Unit mining is accomplished with electric shovels and truck haulage to the 60,000 ton per day concentrator. A dump leaching and a 6000 gpm SX-EW plant are also in operation. The concentrates and cathodes are shipped to San Manuel.

At Miami solutions from the in-situ leaching of the old Miami Copper block cave area are treated by SX-EW. The project to slurry and leach the old Miami Copper tailings is still under development.

PHELPS DODGE CORPORATION

Corporate Headquarters - 2600 North Central Avenue, Phoenix, Arizona 85004-3015 - Phone (602) 234-8100

Phelps Dodge is the nation's largest copper producer. In 1987 it accounted for one third of the nation's copper production at its mines in southeastern Arizona and southwestern New Mexico. In conjunction with its Arizona operations, Phelps Dodge operates the Hidalgo Smelter near Playas, New Mexico, a mine at Tyrone and the former Kennecott properties near Silver City, New Mexico in which it owns a two-thirds interest. These properties contributed 235,000 tons to Phelps Dodge's account.

The Chino Mines Branch consists of an open pit copper mine, a 37,500 ton per day concentrator, a dump leach precipitation plant and a 500,000 ton per year INCO Flash smelter with an acid plant. A 35,000 ton per year solvent extraction-electrowinning plant is planned. The mine and concentrator are located at Santa Rita about 15 miles east of Silver City and the smelter is located about 9 miles south of the mine at Hurley.

At Tyrone, about 10 miles south of Silver City, Phelps Dodge operates an open pit copper mine and concentrator which produced 123,900 tons of copper in concentrates and precipitates in 1986. The solvent extraction-electrowinning plant rated at 35,000 tons per year produced an additional 35,400 tons of copper in 1986. Expansion of the plant is in progress and further expansion is under consideration.

The Hidalgo smelter near Playas, New Mexico is an Outokumpu flash furnace rated at 500,000 tons per year. During 1986 the oxygen enrichment plant from the Morenci smelter was installed to increase capacity and efficiency. The resulting increase in sulfur dioxide concentration of the gases improved the operation of the acid plant as well.

The development of an underground mine at the Dos Pobres property near Safford, Arizona was suspended in 1982 and allowed to flood in August 1984 and remains inactive. In 1986 Phelps Dodge acquired the nearby Lone Star property from Kennecott.

At Copper Basin near Prescott, Phelps Dodge has continued to pursue a land trade with the Forest Service. There are no current plans to develop the property, however.

Morenci Branch - Morenci, Arizona 85540 - Phone (602) 865-4521

The Morenci Branch consists of the combined Morenci-Metcalf open pit copper mine, the 60,000 ton per day Morenci concentrator with a molybdenum circuit, the 40,000 ton per day Metcalf concentrator and a dump leach - SX-EW operation. The 650,000 ton per year smelter with a 2400 ton per day acid plant remain inactive and will require extensive modifications to meet air quality restraints if ever reactivated. Somitomo Mining Arizona, Inc. holds an undivided 15% interest in the Morenci branch excluding the inactive smelter.

PHELPS DODGE CORPORATION (CONT)

Mining is conducted with electric shovels and truck haulage utilizing a computer controlled Modular Mining Truck Dispatching System for maximum efficiency. These will feed the In Pit Crushing and Conveying system (IPCC) which will deliver the crushed ore to a stockpile which will feed both concentrators by conveyor belts. Both concentrators are standard flotation mills except that column flotation cells have been installed in the cleaner circuit of each.

All mined material other than ore is classified as leach material and is taken to one of several leach dumps. There are 3 widely spaced solvent extraction plants to upgrade the solutions before they are pumped to the centrally located tank house for electrowinning. The total capacity of the SX-EW system is 30,000 gallons per minute of pregnant leach solution.

Copper Queen Branch - Highway 92, Bisbee, Arizona 85603 - Phone (602) 432-3621

The Copper Queen facility consists of a dump leaching and precipitation operation at the mined out Lavender pit.

A drilling program on an area north of the Lavender pit was conducted in 1987 to define a possible ore body amenable to treatment by heap leaching and SX-EW. The results of a feasibility study are not yet available.

New Cornelia Branch - Ajo, Arizona 85321 - Phone (602) 387-7451

The New Cornelia Branch consists of an open pit copper mine, a 30,000 ton per day concentrator with a molybdenum circuit and a 190,000 ton per year smelter with an acid plant. The mine has been inactive since August 1984 and the smelter was shut down in April 1985. There are no immediate plans to reactivate the operation.

SEVERANCE TAX ON METALLIFEROUS MINERALS

Background

Laws of 1982, Chapter 230, repealed the tax on sales of metalliferous minerals and enacted a severance tax in its place. Under the provisions of the severance tax, metalliferous minerals were to be taxed at the time of production, not at the time of sale. All metalliferous minerals produced after 1982 were to be taxed on the greater of the following 2 values:

1. The "weighted mineral value" which is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed, or
2. A specified percentage of the old sales tax base.

The severance tax was to be levied on metalliferous minerals at a rate of 2 1/2 percent. Unless otherwise provided by law, the tax was to be administered in the same manner as the sales tax. As a result, severance tax payments were due on the first day of the second month following the month in which the tax accrued. From January 1, 1983 through June 30, 1983, 40 percent of the severance tax was to be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). In subsequent fiscal years, a progressively larger share of the severance tax was to be distributed in the same manner as the transaction privilege tax. The balance of severance tax collections, after making this distribution, was to be deposited each year in the state's general fund. (Effective from and after December 31, 1982.)

Laws of 1983, Chapter 4 changed the due date for payment of the Severance Tax to the twentieth day of the month following the month in which the tax accrues. Taxes were to be delinquent if not received by the Department of Revenue on the day preceding the last day of the month in which they were due. (Effective April 1, 1983). The law also changed the interest rate on delinquent tax payments to equal the rate established by Section 6621 of the Internal Revenue Code, compounded annually. (Effective February 11, 1983.)

Legal Citation

A.R.S. 42-1461 - 42-1466.

Paid by

Persons engaged in the business of extracting substances from the earth that become metalliferous minerals (A.R.S. 42-1461 - 42-1462.)

Exemptions

None.

SEVERANCE TAX ON METALLIFEROUS MINERALS (CONT)

Tax Base

The severance tax is levied on the "net severance base" of all metalliferous minerals produced after 1982 (42-1462). The "net severance base" is the greater of the following 2 values (42-1464, Laws of 1982, Chapter 230, Section 12):

1. The "weighted mineral value", or
2. A specified percentage of the old sales tax base (the gross value of production less out-of-state processing costs). This value will be referred to as the "Arizona value" after June 30, 1985.

The "weighted mineral value" is essentially the cost of extracting the minerals from the earth and delivering them to the site where they will be processed.

The "weighted mineral value" is determined using the following formula (42-1464):

$$\text{weighted mineral value} = \frac{\text{mining costs}}{\text{total production costs}} \times \text{gross value of production}$$

where:

mining costs represent the cost of extracting the minerals from the earth and delivering them to the site where they will be processed further (42-1461).

total production costs include most of the major costs incurred in mining and processing minerals until the point of sale (42-1461).

gross value of production is determined by multiplying the recoverable units of a metallic product by the per unit price of the product; the price per unit does not include the cost of manufacturing, fabricating or otherwise transforming a refined mineral product, when these activities occur prior to sale of the product (42-1461).

Although metalliferous minerals will no longer be taxed on the old sales tax base, the value of minerals produced after 1982 may not fall below a specified percentage of the old tax value (42-1464, Laws of 1982, Chapter 230, Section 12). The old tax value included not only the cost of extracting the minerals from the earth, but most of the major in-state costs of producing the minerals. This value was determined by multiplying the recoverable units of a metallic product by the per unit price and deducting the out-of-state processing costs from the result (42-1464; Laws of 1982, Chapter 230, Section 12; 41-1461). The following table shows the minimum percentage of the old tax value that may be assigned to minerals for severance tax purposes (42-1464; Laws of 1982, Chapter 230, Section 12):

SEVERANCE TAX ON METALLIFEROUS MINERALS (CONT)

<u>Period during which minerals are produced</u>	<u>Minimum value of minerals for purposes of determining the severance tax</u>
January 1, 1983 - June 30, 1983	100% of the old taxable sale value
July 1, 1983 - June 30, 1984	83-1/3% of the old taxable sale value
July 1, 1984 - June 30, 1985	66-2/3% of the old taxable sale value
July 1, 1985 and thereafter	50% of the old taxable sale value

Tax Rate

During fiscal years 1980-81, 1981-82 and 1982-83, businesses that produced mineral products were permitted to claim a tax credit against the Special Excise Tax for Education. The tax credit was determined by formula (see "TAX CREDIT" under "SPECIAL EXCISE TAX FOR EDUCATION"). The tax credit could not exceed the taxpayer's Special Excise Tax liability for the year. However, if a taxpayer had an unused amount of credit for any year in which his production was curtailed due to economic conditions, the unused credit could be carried forward for a period not to exceed three years. Since the Special Excise Tax does not apply to metalliferous minerals after December 31, 1982, businesses that produce metalliferous minerals are authorized to claim this tax credit against their severance tax liability, beginning in 1983. In 1982-83, the amount of credit claimed may not exceed 40 percent of the taxpayer's severance tax liability (Laws of 1982, Chapter 228, Section 2; Laws of 1982, Chapter 230, Section 15).

Due Date

Collections from the severance tax on metalliferous minerals are due on the twentieth day of the month following the month in which the tax accrues. Taxes are delinquent if they are not received by the Department of Revenue on the day preceding the last day of the month in which they are due. The due date may be extended by the Department of Revenue for good cause, but not beyond the first day of the third month following the regular due date (42-1465, 42-1322).

Collecting Agency

Department of Revenue. (42-1462, 42-101)

Dedication or Purpose

To aid in defraying the necessary and ordinary expenses of the state, cities, and counties to reduce or eliminate the annual tax levy on property for state, city and county purposes and to reduce the levy on property for public school education (Laws of 1982, Chapter 230, Section 17).

Yield

No monies will be collected from this tax until fiscal year 1982-83.

SEVERANCE TAX ON METALLIFEROUS MINERALS (CONT)

Distribution

Each year, a portion of severance tax collections will be distributed in the same manner as the transaction privilege tax (i.e. 25 percent to the cities, 33.6 percent to the counties and 41.4 percent to the state). The portion of collections that is distributed in this manner will increase each fiscal year until 1986-87. The table below shows the amount of severance tax collections that will be distributed in the same manner as transaction privilege taxes during each fiscal year (42-1465, Laws of 1982, Chapter 230, Section 16).

<u>period during which collections are received</u>	<u>portion of severance tax collections distributed in the same manner as the transaction privilege tax</u>
January 1, 1983 - June 30, 1983	40%
July 1, 1983 - June 30, 1984	48%
July 1, 1984 - June 30, 1985	60%
July 1, 1985 and thereafter	80%

After making this distribution the balance of severance tax collections will be deposited each year in the state's general fund and is appropriated for public educational purposes (42-1465; Laws of 1982, Chapter 230, Section 16).

TABLE VI (CONT)
AVERAGE COPPER CONTENT OF ORE PRODUCED AT ARIZONA COPPER MINES

() Percentage in parenthesis is approximate: not used in calculation of weighted average.

(1 *Included ANAMAX share of Palo Verde deposit for 1979-1982.*

(2 *Combined as Mission Complex in 1985.*

(3 *Ray Unit acquired from Kennecott November 18, 1986.*

(4 *Grade reported for Ray Unit is an average of oxide and sulfide together through 1982.*

(5 *Sierrita, Esperanza and Mineral Park acquired from Duval Corp. April 1, 1986.*

(6 *Combined Metcalf and Morenci mines production in 1983 et seq.*

(7 *Bluebird property acquired by Inspiration in 1984.*

(8 *Weighted average grade of ore milled, based generally on an assay of total copper.*

TABLE XI
COPPER MINE CAPACITY IN ARIZONA (1
(Short tons of Recoverable Copper/Year)

<u>OPERATOR</u>	<u>MINE</u>	<u>CAPACITY</u>
Phelps Dodge	Morenci/Metcalf	270,000
Magma	San Manuel	130,000
Asarco	Ray	122,000
Cyprus	Sierrita/Esperanza	120,000
Magma	Pinto Valley	85,000
Cyprus	Bagdad	85,000
Inspiration	Inspiration Area	77,000
ASARCO	Mission Complex	62,000
Phelps Dodge	New Cornelia	40,000
Cyprus	Mineral Park	17,000
Cyprus	Casa Grande	16,000
Inspiration	Christmas	8,000
Magma	Miami	6,000
Magma	Copper Cities	2,000
Phelps Dodge	Copper Queen/Lavender	2,000
TOTAL		1,042,000
-----		-----
-----		-----

- 1) *Figures generally represent a current estimate of the productive capacity of primary recoverable copper in concentrates, precipitates, and cathodes. Figures do not represent smelter or refinery capacity. The estimates are based on recent production figures and on capacities of concentrator and leach plant facilities. Other factors affecting actual production include, for example, grade of ore and recovery. Some capacities have been published by the reporting company.*

1987	10,340	299,297,407	28,946	556.65	166,113,000

(1) "Covered Employment" by law includes all employees of employers of three or more persons. Prior 1966 only a portion of the workers in smelting, refining and rod fabrication were included in this table.

(2) Mine production in short tons of lode ore from "Arizona, Mine Production by Class of Ore", report by U.S. Bureau of Mines. In 1982 and thereafter the tonnage may include copper-zinc, copper-lead and lead-zinc ore combined to avoid disclosing individual company confidential data.

TABLE XVIII

**\$1,791,515,000
VALUE OF
COPPER INDUSTRY OUTPUT**

Circulation and recirculation of the direct impact of copper industry spending creates a "ripple effect" that expands the direct economic impact of the copper industry on Arizona to a total impact that is over five times greater than the direct impact itself.

**DIRECT AND INDIRECT IMPACTS
OF THE COPPER INDUSTRY ON THE ARIZONA ECONOMY
1987**

TABLE XIX (CONT)
EMPLOYMENT, EARNINGS AND HOURS IN COPPER MINING
IN THE UNITED STATES AND ARIZONA (1

- 8
- (1) *Statistics do not reflect workers in copper smelting, refining and rod fabrication.*
 - (2) *These figures are estimates made by the Arizona Department of Economic Security, in cooperation with the U.S. Bureau of Labor Statistics, and they include all full and part-time wage and salary workers who were employed in copper mining in any part of the pay periods which included the 12th of each month of the year.*
 - (3) *Estimates made by the U.S. Bureau of Labor Statistics, in cooperation with the 50 states, and based upon monthly samplings similar to those in (2) above, adjusted periodically to census bench mark.*
 - (4) *Estimates of production (non-supervisory) workers based upon samplings as in (2) above. Since 1975, figures have been calculated by the Arizona Department of Mines and Mineral Resources dividing the annual number of "All Employees-Arizona" by a factor of 1.26. This factor was derived by comparing the annual number of "All Employees-Arizona" with "Production Workers - Arizona" from 1970 to 1974.*
 - (5) *Earnings figures for a particular year is the product of "Average Hourly Earnings" and "Average Weekly Hours" for that year.*
 - (6) *Gross payroll aggregates, exclusive of irregular bonuses and other pay not earned in a sample pay period, are divided by gross man-hour aggregates of production and related workers for the period in order to determine average hourly earnings.*
 - (7) *"Average Weekly Earnings" times 52 weeks.*
 - (8) *Number of production workers times "Average Weekly Hours" times 52 weeks.*

Cash Cost (4	<u>77</u>	<u>69</u>	<u>65</u>	<u>59</u>	<u>56</u>	<u>69</u>
Production Thousand Short Tons (5 of Copper	989	1,027	1,203	1,222	1,180	1,504

(1) Includes 16 mines, most of which were producing from 1982 to 1986.

(2) Long run costs include depreciation allowances to sustain production.

(3) Property and severance taxes and royalties, if applicable.

(4) Includes all cash cost of production and credit for byproducts but excludes depreciation and profit (except long run costs). Costs are in actual dollars for each year shown.

(5) Based on the production of the 16 mines analyzed. Long run production is estimated full capacity level. Capacities are averaged over the life of the mine.

(6) Includes 13 mines. Mill costs are combined in 1985-6.

(1 **Reserve Base** - That part of an identified resource that meets specified minimum physical and chemical criteria related to current mining and production practices, including those for grade, quality, thickness, and depth. The reserve base is the in-place demonstrated (measured plus indicated) resource from which reserves are estimated. It may encompass those parts of the resources that have a reasonable potential for becoming economically available within planning horizons beyond those that assume proven technology and current economics. The reserve base includes those resources that are currently economic (reserves), marginally economic (marginal reserves), and some of those that are currently subeconomic (subeconomic resources).

THE ARIZONA DEPARTMENT OF MINES AND MINERAL RESOURCES

The Department's task is to promote the development of Arizona's mineral resources. This is accomplished through technical research, field investigations, compilation of information into a mineral occurrence data base and disseminating information through publications, personal contacts and seminars.

The Department's mining engineers and geologists assist mining and exploration companies, prospectors and others interested in Arizona's minerals with mineral processing, mineral land acquisition, exploration, mine development, financing, government regulations and marketing.

The Department is a service agency and does not regulate, tax or require any type of registration. The agency provides many different services tailored to meet the differing needs of the public. The following list of services are those which the explorationist may find of benefit.

- Maintain a site specific data base of unpublished reports and maps which includes 5,000 mine files and indexes of 10,000 computerized Arizona mineral locations.
- Maintain an information bank and library of mineral and mining information including, a mine map library (hard copy and microfilm), government publications, periodicals, and unpublished master and doctorate theses.
- Gather and disseminate information on commodities and markets.
- Suggest target areas for possible exploration activity.
- Suggest prospects and individual properties for study and acquisition.
- Assist individuals and companies in their dealings with State regulatory agencies to facilitate their mining and exploration activity.
- Provide publications in the form of mineral reports, annual directories, technical reports, annual mineral industry surveys and information circulars. These include *Laws and Regulations Governing Mineral Rights in Arizona*, *Directory of Exploration Offices in Arizona*, *Manual for Determination of Status and Ownership of Arizona Mineral and Water Rights*, and others. A current listing of the Department publications is available upon request.
