# WAGE STATISTICS AND COPP $2 R$ OUTFUT IN 

ARIZONA COPPER MINES

Years 1953-1958 Compared With Base Period 1947-1949
Source: Arizona Employment Security Commission, U. S. Dept. of Labor, U. S. Bureau of Mines.

The Arizona Department of Mineral Resources has recently compiled several tables of wage statistics and copper output of Arizona copper mines, and has compared them with wages paid in other major industries in Arizona and the United States.

The base period of 1947-1949 has been used in making comparison because that is the period used by the U. S. Department of Labor in determining the Consumer Price Index (or Cost of Living).

As in previous reports, the Arizona Department of Mineral Resources has shown that hourly wage-rates in the copper mining industry have been increased annually at a much greater rate than the Consumer Price Index.

The copper miner's output has been a poor measure of his worth, because of many factors beyond his control. A lowering of metal content of copper ore would have an effect on the output of copper per man-hour of labor, and the miner can hardly be responsible for this. On the other hand, the employer can hardly be expected to raise a man's wages, under the same conditions, except possibly in proportion to the rise in the cost of living.

Increased output of copper ore per miner is more than likely due to the larger proportion of open-pit production by the use of mechanized shovels. The proportion of open-pit ore tonnage has increased from $30 \%$ in 1940 to over $82 \%$ in 1956. This proportion has been reduced to about $76 \%$ in 1957, and about $75 \%$ in 1958, due to the large underground mine at San Manuel reaching full production in the last two years. Technological advances in both open-pit and underground mining, especially in the development of improvements in mechanized equipment, have been the chief factor in increased output per man. Likewise, in the milling of the ore, increase in recovery has been entirely due to technological and mechanical improvements. The big copper producers have spent millions of dollars in technological research.

It seemed fitting that, in making comparisons of output per man, the full number of covered employees in the copper mining and milling business in Arizona be used, rather than the number of production workers only. It can hardly be denied that each and every individual employee of a copper company has a hand in the production of each pound of copper. The total Arizona copper mining and milling payroll, as a matter of fact, really falls short of the total direct labor involved in the production of copper. There is still the labor at the smelters, and on the railroads transporting the blister copper to the east coast for refining, and then the labor at the copper refineries. The indirect labor involved in the production, manufacture and transportation of supplies
and equipment to the copper mines, mills and smelters in Arizona would further increase labor's proportion in the cost of producing copper.

Because the by-products of gold and silver produced with the copper are factors in determining the miner's output, the total value of metal produced is converted into pounds of copper at the average copper price.

In spite of the collapse of copper prices in 1957 and 1958, when copper prices dropped from a high of 36 cents in January of 1957 to a low of 24.2 cents in March of 1958, the copper miner's base hourly wage has continued to rise, due to a three-year union contract made in June of 1956, when copper was selling for 46 cents a pound. This contract called for wage increases in July of the years 1956, 1957 and 1958. The base hourly wage in 1955 averaged $\$ 2.075$; in 1956 it averaged $\$ 2.215$; in 1957 it averaged $\$ 2.324$; and in 1958 it averaged \$2.399. This was a total increase of 32.4 cents an hour for the years 1956, 1957 and 1958, during the time the price of copper was dropping from 46 cents to less than 25 cents per pound. The base hourly rates used above were obtained by dividing the weekly earnings by the weekly hours plus one-half the overtime hours in excess of 40 hours per week. The Employment Security Commission reports show the actual hours worked each week and include overtime earnings in their weekly earnings column.

Comparing results for the year 1958 with the base-period, 194.7-1949, and summarizing briefly, it is found (in Table VIII) that the tons of ore mined per man increased $18.7 \%$, or from 3,377 tons per man-year in the base period, to 4,008 tons per man-year in 1958. There is no doubt that practically all of this increase was due to open-pit mining, using mechanized shovels and trucks. The annual wage of the copper miner, not including fringe benefits, has increased $52.3 \%$, or from $\$ 3,496$ to $\$ 5,326$. In"constant dollars" (using the 1947-1949 period as 1.000 ), this increase would be $23.3 \%$, or from $\$ 3,496$ per man-year to \$4,312 per man-year.

The annual pounds of equivalent copper produced per man-year has increased $5.3 \%$ during the 9 -year period, or from 66,329 pounds copper per man-year to 69,839 pounds. Here again, technological improvements would account for most of this. The wage-cost per pound of equivalent copper has increased $44.7 \%$, or from $\$ .05271$ per pound of copper to $\$ .07626$ per pound. In constant dollars, this increase would be 17.2\%, or from $\$ .05271$ per pound in 1947-49 to $\$ .06176$ per pound in 1958.

The Consumer Price Index has increased $23.5 \%$ from the base period to the end of 1958 , or an average of $2.6 \%$ per year for nine years. A table of reciprocals of this price index is shown in Table VII. These reciprocals were used to calculate "constant dollars!

Copper mining and smelting wages in 1958 amounted to an estimated $\$ 84,100,000$, and do not include fringe benefits, which are estimated to amount to about 20 percent of the payroll.

While average wages per man-year in Arizona copper mining, have increased $5.8 \%$ per year for nine years ( $2.6 \%$ increase per year in "constant dollars"), copper output per man-year has increased only $0.6 \%$ per year. Result-inflation.

WAGES CAN BRING ABOUT INFLATION

Last year, after two years' study of our economy, the Committee for Economic Development came up with what they believed was the major factor causing inflation, namely that real wages of labor cannot rise faster than real output. In other words, we must get rid of the illusion that we can get more out of the economy than we produce. The Committee has calculated that since World War II, real output, or productivity, has been growing at an average of only 2 to 3 percent a year - while wages, on the average, have been climbing 5 to 6 percent a year. "The dirference" said the Committee, "is inflation. Increase in real income must come from increases in productivity!

As shown in the above discussion on wages and output in Arizona Copper Mining, and supported by the data in Tables VI, VII and VIII, copper metal output per man-year has increased only 0.6 percent a year over the last nine years, while annual wages, not including fringe benefits, have increased about 5.8 percent a year.

## ESTIMATED HOURS AND EARNINGS IN SELECTED INDUSTRIES IN ARIZONA

YEAR 1958
Source: "Arizona Current Employment Developments" Employment Security Commission.

These estimates are based upon a sample of full and part-time production and related employees whose payroll and hours are reported for the pay period ending nearest the 15 th of the month.

| 1958: | Average Employment | Average Hourly Earnings | Average Weekly Hours | Average Weekly Earnings |
| :---: | :---: | :---: | :---: | :---: |

$\because$ This number includes all covered employees on payroll, and is not restricted to production workers only, on which
the average hourly and weekly earnings are reported.
说 Smelting employment has been segregated from Manufacturing as reported by the Employment Security Commission. Note: Fringe benefits are not included in the total wages.

* This number includes all covered employees on payroll, and is not restricted to production workers only, on which the average hour $\overline{\bar{y}}$ and weekly earnings are reported.
${ }_{*}$ S Smelting employment has been segregated from Manufacturing as reported by the Employment Security Commission. Note: Fringe benefits are not included in the total wages.
Arizona Department of Mineral Resources
