Arizona Department of Mines and Mineral Resources Mining Collection

## **ACCESS STATEMENT**

These digitized collections are accessible for purposes of education and research. We have indicated what we know about copyright and rights of privacy, publicity, or trademark. Due to the nature of archival collections, we are not always able to identify this information. We are eager to hear from any rights owners, so that we may obtain accurate information. Upon request, we will remove material from public view while we address a rights issue.

## **CONSTRAINTS STATEMENT**

The Arizona Geological Survey does not claim to control all rights for all materials in its collection. These rights include, but are not limited to: copyright, privacy rights, and cultural protection rights. The User hereby assumes all responsibility for obtaining any rights to use the material in excess of "fair use."

The Survey makes no intellectual property claims to the products created by individual authors in the manuscript collections, except when the author deeded those rights to the Survey or when those authors were employed by the State of Arizona and created intellectual products as a function of their official duties. The Survey does maintain property rights to the physical and digital representations of the works.

## **QUALITY STATEMENT**

The Arizona Geological Survey is not responsible for the accuracy of the records, information, or opinions that may be contained in the files. The Survey collects, catalogs, and archives data on mineral properties regardless of its views of the veracity or accuracy of those data.

*matting dust* (Yavapai County, Arizona)

Tungsten property comprising two claims, foot of Yarnell Hill,  $1\frac{1}{2}$  miles westerly from Phoenix Prescott Highway.

Fifteen hundred foot fracture. Vein of oxidized material approximately six inches to two feet wide, in which occurs streaks of high grade Ferberite one to  $1\frac{1}{2}$  inches thick from 20% to 60%  $WO_3$ . Oxidized material shows values of upwards to  $2\frac{1}{2}\%$   $WO_3$ . The highgrade tungsten comes in say for twenty of thirty feet along the vein and then eight of ten feet in depth, then disappears, and on sinking reappears again for say ten or twelve more feet in depth.

Development work consisted of trenching along the fracture and sinking in a couple of places to a maximum depth of 40 feet. High grade ore shipped ran from \$560.00 per ton to a \$1000.00. Second grade, rejects about 8%  $WO_3$ . Oxidized material not saved.

At the time work was stopped, April 30, 1944, deepest workings were about forty feet and the high grade had just pinched out although the vein was there and good and we intended to go on down to the next highgrade (this had occurred three times before) when the Metals Reserve cancelled the Purchase Contract and we weren't warranted to spend the money for further sinking or exploration with no market for our product if we did open up more high grade.

Property is still a good prospect and might work into something with further work and development. Past experience has shown that it will pay its way.
