ACCESS STATEMENT

These digitized collections are accessible for purposes of education and research. We have indicated what we know about copyright and rights of privacy, publicity, or trademark. Due to the nature of archival collections, we are not always able to identify this information. We are eager to hear from any rights owners, so that we may obtain accurate information. Upon request, we will remove material from public view while we address a rights issue.

CONSTRAINTS STATEMENT

The Arizona Geological Survey does not claim to control all rights for all materials in its collection. These rights include, but are not limited to: copyright, privacy rights, and cultural protection rights. The User hereby assumes all responsibility for obtaining any rights to use the material in excess of "fair use."

The Survey makes no intellectual property claims to the products created by individual authors in the manuscript collections, except when the author deeded those rights to the Survey or when those authors were employed by the State of Arizona and created intellectual products as a function of their official duties. The Survey does maintain property rights to the physical and digital representations of the works.

QUALITY STATEMENT

The Arizona Geological Survey is not responsible for the accuracy of the records, information, or opinions that may be contained in the files. The Survey collects, catalogs, and archives data on mineral properties regardless of its views of the veracity or accuracy of those data.

RECEIVED

December 27, 1969

Mr. Sherwood B. Owens
P. O. Box 769
Tucson, Arizona

Dear Mr. Owens:

Herewith a letter report on the exploration completed on the Hungry Hill Claims in Section 23 of T. 11 N., R. 14 W. in the southeast part of Mohave County, Arizona, just north of the Bill Williams River and a few miles northwest of Browns Crossing.

GENERAL:

A limited amount of air-track type drilling was done on the copper oxide exposure to satisfy ourselves as to the continuity of the mineralization into the prominent hill, or to disprove same. Four drill hole locations were selected by the writer and approved by yourself and Mr. G. Freeman. It was agreed that these four holes, drilled to a 100 foot depth, would satisfactorily prove or disprove the existence of mineralization over a fair sized area.

This drilling was completed between November 18 and November 28, 1969 and was completed by Metler Bros. Drilling Co. of Tucson, Arizona.

CONCLUSIONS:

The negative results of the samples obtained from the drilling of the four strategically placed drilled holes definitely proves that the copper oxide mineralization expression on the surface and in the very shallow workings is purely superficial in nature and has no continuity beyond the depth of the exposures.

Because of the negative results, the project was abandoned and no further work completed other than to do some surveying in order to complete to some extent a general surface map to show what had been done -- mostly factual data.

Had the drilling results been encouraging, surface geologic mapping would have been completed.

THE PROPERTY:

The original Hungry Hill property consisted of six claims. Mr. L. Drake, at your request, located additional claims to surround the original six claims and to "block in" the area between the Hungry Hill

property and the Deer Trail (Iron Claims) property to the northeast and which consisted of eleven claims. The additional Hungry Hill claims are numbered 7 through 28. The writer surveyed but a few of the new discovery locations of these claims in order to determine their relative ground position. Mr. Drake pointed out to the writer four of the perimeter corners of the original six Hungry Hill claims. These were also surveyed.

It is the writers opinion that the staking of these new claims was very hap-hazardly done as indicated by the great over lapping of many of the new claims and the existence of several fractions, as well as the fact that some of the "locations" are actually on the original six claims and therefor not a legal claim.

The writers survey of the important points, including drill hole locations was completed using a range-finder and brunton compass, starting from established points as Section or quarter Section corners which were found in the area.

DRILLING and SAMPLING:

Four holes (designated D. H. 1 through 4) were drilled in the main area of mineralization, one hole, D. H. "A" was drilled to test a very small area of mineralization and four holes, Loc. 1, 3, 4, and 5 were drilled to validate the new claims. D. H. 4 also doubled as Loc. 2 to validate the new claims. In all, 640 feet of drilling was completed. The location of these drilled holes are shown on the included Surface Map.

Each ten feet of each hole was sampled. The entire sample was split to a final sample of approximately 12 pounds. From this portion, a small sample of approximately one pound was taken and sent to Jacobs Assay Office, Tucson, Arizona for analysis of total copper. The remaining eleven pounds of the final sample were bagged and currently in storage at the writers office and same shall be retained by him for a month, after which they shall be discarded.

The copper assays of these samples are shown in the included Sampling and Assay Record.

Respectfully submitted,

R. E. Mieritz,
Mining Consultant
Phoenix, Arizona
