DEKALB Mining, Inc.

January 27 1982

Mr. Stanley L. Scarth
Scarth Oil and Gas Company
205 Paramount Plaza
Amarillo, Texas 79101

Dear Mr. Scarth:

Gary Parkison, from our Albuquerque office, has shown me two reports; one on the Alvarado Gold mine in Yavapai County, Arizona, and the other on the Tule Canyon Placer in Esmeralda County, Nevada.

I have reviewed both offerings in the context of DEKALB's current exploration objectives and have concluded that we would not be interested in a venture on the Alvarado mine. Mr. Parkison will be returning the report to you.

I've asked our placer specialist in Denver, Kerry Stanaway, to also review the report on the Tule Canyon Placer. You will hear directly from him of any interest DEKALB might have. I've also asked him to return your report and maps if we have no plans to enter the Tule Canyon venture.

Let me personally thank you for submitting the two properties to DEKALB and wish you success in your mining activities.

Sincerely,

DEKALB Mining, Inc.

N. L. Archbold

Scarth Oil & Gas - Alvarado Gold Mine,
Yavapai County, AZ.

~~Claims~~

Vein ~~dips~~ strikes ENE, dips ~ 25° to the NNE, according to maps, only < 1 claim width in vein, along projection of main shaft only ~ 200' in plan view vein is within then claims, the downdip extension (from 2nd level down) is not claimed by anyone?!!

Assays by Neill - 1907, > 500 assays ave. .27 oz/T Au

Tonnage 1935-1943 = 139,312 Tons
Au = 24,784 oz = .1779 oz/T
Ag = 31,236 oz = .2242 oz/T
talc ~ .05 so .18 + .05 = .23 oz which near Neill figures of 1907

Moore assays to 6th level - 85 assays, ave. .17 oz/T Au in vein and mineral. adj. wallrock

Vein is along porphyry dike., vein from 0 to 8' thk, ave. about 3.0 feet. to qtz. w/ pyrite. Some question as to possible low grade value in adjacent wallrock.

Calc. 750,000 Tons ore total @ 18 $/ton.
150,000 mined = 600,000 Tons left.

Mine dumps prob. can be reworked

At present economics, vein prob. not worth it - 3 ft. @ .17 oz/T is only .102 oz/T at 5' which is at best $ 50.00/Ton.
Only possibility is the values in adjacent rock.
But could be richest. if get other props. in area. Empl. done to date is good, could mine thick, higher grade areas??

Scarth Oil & Gas - 12/14/81

Dekalb Mining
Mr. Gary Parkinson
958 Antelope N.E.
Albuquerque, NM 87122

Dear Mr. Parkinson:

Pursuant to our telephone conversation of this morning, please find attached a copy of the Alvarado Gold Mine Report, the Tule Canyon Report, and the Tule Canyon Supplemental Report.

If I can be of further assistance to you on this matter, please do not hesitate to call me. If you are not interested in the properties, please return the reports to our office.

Yours truly,

Stan Scarth

Believe have ~ 300,000 Tons proven @ .10 - .15 oz/T Au at Alvarado Mine. Alvarado accessible at present to the 6th level. Have 158 acres, controlled.
These properties advertised in Min. Engineering, Nov 81, p. 1651
I did not ask him about the placer property, but as noted in advertisement I asked him to send along this data and would forward to you in Sparks.

Location : The Gold Bar mine is situated 17 mi northeast of Wickenburg, Arizona in the Black Rock district of southern Yavapai Co. The mines specific location and the general geology of the surrounding area have been summarized in an earlier report [memo to JBT; KME - 1/19/82] and will not be repeated here. The area was visited ([redacted]) by myself and D.J. Wronkiewicz [redacted] on Jan 28 to ~~Geological mapping and sampling results~~ :

31, 1982. a total of 3 field days was spent on the site (6 man days).

Economic Geology:

Production and History — all of the information in this section was gleaned for past engineering and geological evaluations supplied by Steve Ivanov, who currently holds a lease on the property.

(P) The Gold Bar mine was initially discovered in 1879 and was mined by numerous concerns between 1901 and 1918. The mine has since been inactive. Production has amounted to 25,000 tons of ore with a grade that averaged better than 0.60 oz/ton Au with minor silver. The ore consists of pyritic replacements of what has been variably described as brecciated Precambrian granite and Tertiary intrusive quartz-porphyry. Abundant quartz-pyrite veinlets cut the ore body which is in the form of a pipe with a silicified outer ring. The structure is 40 feet or more in diameter and plunges about

30° to the southwest. The tonnage of ore remaining has been estimated between 20 and 80 thousand tons in previous evaluations. The ore appears to have been faulted off about the 500 foot level, but may have been relocated 50' to the northwest, if the drilling data shown on a Goldhurst Resources Inc mine map is accurate. A 700 foot shaft exists on the site and is currently (?) being reconditioned by Steve Ivanov. Except for a large open stope (#1 Glory Hole) which extends 1100 feet downdip from the pipes apex, the workings are presently inaccessible. As many as five larger pipe-like outcrops of brecciated and silicified rock have been recognized during previous investigation of the properties. Molybdenum has been reported from the outcrops of these structures, and the area was drilled by Rio Amax in 1976 as a possible Mo porphyry target.

Results of Mapping and Sampling —

Mapping of the area showed hydrothermally mineralized faults and fractures, as well as 8 outcrops of silicified breccia. These outcrops were also recognized during work by Goldcrest Resources, but their size and form differed somewhat from what their map shows. All of the structures appear to be developed in older granitic rocks, but at least one (#6 pipe) locally with originally suggesting an associated Tertiary(?) intrusive rocks. has a fine-grained porphyritic matrix. Small outcrops of similar intrusive were noted in the area near the #2 or #3 pipes. The outcrop pattern of the #4, #5 and #6 pipes gives some suggestion of being part of an annular ring on a much larger structure (see map).

The sampling done on the breccia occurrences was encouraging. Every outcrop sample taken was anomalous in gold with the range being 0.37 ppm to 1.71 ppm. The

(A) a total of 33 samples were taken from the Gold Bar area. Samples from the Glory Hole (#1 pipe) all ran better than 0.11 oz/t Au (F44, 45, & G103). A 20' foot crosscut into the surrounding rock (F46) suggests that the pipe has an "assay wall" and could contain ore grade material across a width of 30 feet or more. The results of breccia outcrop sampling was also encouraging. The silicified outcrop above the Glory Hole ran 0.81 ppm (F47); every other breccia occurrence sampled contained anomalous amounts of gold with the range being 0.36 ppm to 1.71 ppm. All of the pipes had higher outcrop Au values than the #1 pipe with the exception of the #3 occurrence. Almost all of the samples contained anomalous Mo values, but nothing approaching ore grade (192 ppm max.) was encountered.

6

A number of mineralized fractures and veins in the area south and east of the Gold Bar mine were sampled during this study. All of them (G89 → G92 and G94 → G99) were anomalous in Au and two (G90 + G92) are wide (8+') and of high enough grade to justify further investigation.

felsic matrix. The two #4 outcrops together suggest in those of the #5 and #6 pipes a large broken ring pattern. This could be a high level expression of a large (1000' by 1500') pipe structure. Many of the veins and mineralized fractures east of the area of pipe outcrops are similarly mineralized Au bearing and on trend with replacement veins exposed on the nearby Red Bluff vein system (remote FBI: KME - 1/19/82). This vein system trends through the area of the #4, #5 & #6 pipes and may be related to the structure that localized these features.

Recommendations : Steve Ivanor should be contacted and terms for an agreement sought out. Successful, additional surface sampling, particularly of outcrops in the interior portions of larger structure, should be conducted to better define initial targets for drilling. Detailed structural mapping should be conducted to determine the attitude of these mineralized features.
